[30399] Another function of VGAM778 is therefore inhibition of LOC148811 (Accession XM\_086326). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148811. LOC150605 (Accession XM\_097927) is another VGAM778 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:41229, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30400] Another function of VGAM778 is therefore inhibition of LOC150605 (Accession XM\_097927). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150605. LOC152065 (Accession XM\_098159) is another VGAM778 host target gene. LOC152065 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152065 BINDING SITE, designated SEQ ID:41429, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30401] Another function of VGAM778 is therefore inhibition of LOC152065 (Accession XM\_098159). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152065. LOC221300 (Accession XM\_166322) is an-

other VGAM778 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:44147, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30402] Another function of VGAM778 is therefore inhibition of LOC221300 (Accession XM\_166322). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221300. LOC221895 (Accession XM\_166511) is another VGAM778 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44445, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30403] Another function of VGAM778 is therefore inhibition of LOC221895 (Accession XM\_166511). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. LOC90170 (Accession XM\_029589) is another VGAM778 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE, designated SEQ ID:30906, to the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, also designated SEQ ID:3489.

[30404] Another function of VGAM778 is therefore inhibition of LOC90170 (Accession XM\_029589). Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 779 (VGAM779) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[30405] VGAM779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM779 was detected is described hereinabove with reference to Figs. 1–8.

[30406] VGAM779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Litura Nucleopolyhedrovirus. VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30407] VGAM779 gene encodes a VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM779 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM779 precursor RNA is designated SEQ ID:765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:765 is located at position 23915 relative to the genome of Spodoptera Litura Nucleopolyhedrovirus.

[30408] VGAM779 precursor RNA folds onto itself, forming VGAM779 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[30409] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM779 folded precursor RNA into VGAM779 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 43%) nucleotide se-  
quence of VGAM779 RNA is designated SEQ ID:3490, and  
is provided hereinbelow with reference to the sequence  
listing part.

[30410] VGAM779 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM779 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM779 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30411] VGAM779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM779 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30412] The complementary binding of VGAM779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM779 host target RNA into VGAM779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30413] It is appreciated that VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM779 host target genes. The mRNA of each one of this plurality of VGAM779 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM779 RNA, herein designated VGAM RNA, and which when bound by VGAM779 RNA causes inhibition of translation of respective one or more VGAM779 host target proteins.

[30414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM779 gene, herein designated VGAM GENE, on one or more VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30415] It is yet further appreciated that a function of VGAM779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of viral infection by Spodoptera Litura Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM779 correlate with, and may be deduced from, the identity of the host target genes which VGAM779 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[30416] Nucleotide sequences of the VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM779 are further described hereinbelow with reference to Table 1.

[30417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM779 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM779 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30418] As mentioned hereinabove with reference to Fig. 1, a function of VGAM779 gene, herein designated VGAM is inhibition of expression of VGAM779 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM779 correlate with, and may be deduced from, the identity of the target genes which VGAM779 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30419] Pentaxin-related Gene, Rapidly Induced By IL-1 Beta (PTX3, Accession NM\_002852) is a VGAM779 host target gene. PTX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTX3 BINDING SITE, designated SEQ ID:8746, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30420] A function of VGAM779 is therefore inhibition of Pentaxin-related Gene, Rapidly Induced By IL-1 Beta (PTX3, Accession NM\_002852), a gene which is similar to the pentaxin subclass of inflammatory acute-phase proteins. Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTX3. The function of PTX3 has been established by previous studies. In a search for genes that can serve as markers of inflammatory reactions involving the vessel wall, Breviario et al. (1992) used differential hybridization to identify several cDNAs that are induced in human umbilical vein endothelial cells by interleukin-1-beta (IL1B; 147720). The only novel gene among these

cDNAs, named PTX3, encoded a predicted 381-amino acid protein with homology to the pentraxin protein family (see OMIM Ref. No. 600750). Based on the Greek derivation, Breviario et al. (1992) suggested that this family be named pentaxin. The PTX3 gene contains 3 exons and is transcribed as a 1,861-nucleotide mRNA. Breviario et al. (1992) mapped PTX3 to 3q25 using somatic cell hybrid analysis and fluorescence in situ hybridization. Basile et al. (1997) suggested that PTX3 belongs to the family of 'long pentraxins', which have C-terminal pentraxin domains and novel amino-terminal domains. They studied the PTX3 promoter and found a 1,317-bp fragment, located 5-prime to the transcriptional start site, that confers TNF- and IL1B-inducible transcriptional activity in transfected fibroblasts. They also identified a functional NF-kappa-B (164011, 164012) site in the promoter.

[30421] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30422] Basile, A.; Sica, A.; d'Aniello, E.; Breviario, F.; Garrido, G.; Castellano, M.; Mantovani, A.; Introna, M. : Characterization of the promoter for the human long pentraxin PTX3: role of NF-kappa-B in tumor necrosis factor-alpha and

interleukin-1-beta regulation. J. Biol. Chem. 272:  
8172-8178, 1997. ; and

[30423] Breviario, F.; d'Aniello, E. M.; Golay, J.; Peri, G.; Bottazzi, B.; Bairoch, A.; Saccone, S.; Marzella, R.; Predazzi, V.; Rocchi, M.; Della Valle, G.; Dejana, E.; Mantovani, A.; Introna.

[30424] Further studies establishing the function and utilities of PTX3 are found in John Hopkins OMIM database record ID 602492, and in cited publications numbered 103 and 8250-8251 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM\_004170) is another VGAM779 host target gene. SLC1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A1 BINDING SITE, designated SEQ ID:10376, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30425] Another function of VGAM779 is therefore inhibition of

Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM\_004170), a gene which is a glutamate transporter, essential for terminating the postsynaptic action of glutamate by rapidly removing it from the synaptic cleft. Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A1. The function of SLC1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM206.Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM\_014379) is another VGAM779 host target gene. KCNV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNV1 BINDING SITE, designated SEQ ID:15714, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30426] Another function of VGAM779 is therefore inhibition of

Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM\_014379). Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNV1. KIAA1028 (Accession XM\_166324) is another VGAM779 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44153, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30427] Another function of VGAM779 is therefore inhibition of KIAA1028 (Accession XM\_166324). Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. LOC201203 (Accession XM\_113920) is another VGAM779 host target gene. LOC201203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201203, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201203 BINDING SITE, designated SEQ ID:42536, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30428] Another function of VGAM779 is therefore inhibition of LOC201203 (Accession XM\_113920). Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201203. LOC221895 (Accession XM\_166511) is another VGAM779 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44446, to the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, also designated SEQ ID:3490.

[30429] Another function of VGAM779 is therefore inhibition of LOC221895 (Accession XM\_166511). Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221895. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 780 (VGAM780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30430] VGAM780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM780 was detected is described hereinabove with reference to Figs. 1–8.

[30431] VGAM780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Litura Nucleopolyhedrovirus. VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30432] VGAM780 gene encodes a VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM780 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM780 precursor RNA is designated SEQ ID:766, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:766 is located at position 95927 relative to the genome of Spodoptera Litura Nucleopolyhedrovirus.

[30433] VGAM780 precursor RNA folds onto itself, forming VGAM780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30434] An enzyme complex designated DICER COMPLEX, `dices` the VGAM780 folded precursor RNA into VGAM780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM780 RNA is designated SEQ ID:3491, and is provided hereinbelow with reference to the sequence listing part.

[30435] VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM780 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30436] VGAM780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM780 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30437] The complementary binding of VGAM780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM780 host target RNA into VGAM780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30438] It is appreciated that VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM780 host target genes. The mRNA of each one of this plurality of VGAM780 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM780 RNA, herein designated VGAM RNA, and which when bound by VGAM780 RNA causes in-

hibition of translation of respective one or more VGAM780 host target proteins.

[30439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM780 gene, herein designated VGAM GENE, on one or more VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30440] It is yet further appreciated that a function of VGAM780 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM780 include diagnosis, prevention and

treatment of viral infection by Spodoptera Litura Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM780 correlate with, and may be deduced from, the identity of the host target genes which VGAM780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30441] Nucleotide sequences of the VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM780 are further described hereinbelow with reference to Table 1.

[30442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM780 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM780 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30443] As mentioned hereinabove with reference to Fig. 1, a function of VGAM780 gene, herein designated VGAM is inhibition of expression of VGAM780 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM780 correlate with, and may be deduced from, the identity of the target genes which VGAM780 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30444] KIAA0471 (Accession NM\_014857) is a VGAM780 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16915, to the nucleotide sequence of VGAM780 RNA, herein designated VGAM RNA, also designated SEQ ID:3491.

[30445] A function of VGAM780 is therefore inhibition of KIAA0471 (Accession NM\_014857). Accordingly, utilities of VGAM780 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 781 (VGAM781) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30446] VGAM781 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM781 was detected is described hereinabove with reference to Figs. 1–8.

[30447] VGAM781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Deer Tick Virus.

VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30448] VGAM781 gene encodes a VGAM781 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM781 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM781 precursor RNA is designated SEQ ID:767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:767 is located at position 6107 relative to the genome of Deer Tick Virus.

[30449] VGAM781 precursor RNA folds onto itself, forming

VGAM781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30450] An enzyme complex designated DICER COMPLEX, `dices` the VGAM781 folded precursor RNA into VGAM781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM781 RNA is designated SEQ ID:3492, and is provided hereinbelow with reference to the sequence listing part.

[30451] VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM781 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30452] VGAM781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM781 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30453] The complementary binding of VGAM781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM781 host target RNA into VGAM781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30454] It is appreciated that VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM781 host target genes. The mRNA of each one of this plurality of VGAM781 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM781 RNA, herein designated VGAM RNA, and which when bound by VGAM781 RNA causes inhibition of translation of respective one or more VGAM781 host target proteins.

[30455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM781 gene, herein designated VGAM GENE, on one or more VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30456] It is yet further appreciated that a function of VGAM781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of viral infection by Deer Tick Virus. Specific functions, and accordingly utilities, of VGAM781 correlate with, and may be deduced from, the identity of the host target genes which VGAM781 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[30457] Nucleotide sequences of the VGAM781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM781 are further described hereinbelow with reference to Table 1.

[30458] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM781 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM781 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM781 gene, herein designated VGAM is inhibition of expression of VGAM781 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM781 correlate with, and may be deduced from, the identity of the target genes which VGAM781 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[30460] DKFZp762L0311 (Accession NM\_018719) is a VGAM781 host target gene. DKFZp762L0311 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp762L0311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762L0311 BINDING SITE, designated SEQ ID:20798, to the nucleotide sequence of VGAM781 RNA, herein designated VGAM RNA, also designated SEQ ID:3492.

[30461] A function of VGAM781 is therefore inhibition of DKFZp762L0311 (Accession NM\_018719). Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762L0311. KIAA0182 (Accession XM\_050495) is another VGAM781 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35641, to the

nucleotide sequence of VGAM781 RNA, herein designated VGAM RNA, also designated SEQ ID:3492.

[30462] Another function of VGAM781 is therefore inhibition of KIAA0182 (Accession XM\_050495). Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA1671 (Accession XM\_037809) is another VGAM781 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:32690, to the nucleotide sequence of VGAM781 RNA, herein designated VGAM RNA, also designated SEQ ID:3492.

[30463] Another function of VGAM781 is therefore inhibition of KIAA1671 (Accession XM\_037809). Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. LOC148823 (Accession NM\_145278) is another VGAM781 host target gene. LOC148823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC148823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:29790, to the nucleotide sequence of VGAM781 RNA, herein designated VGAM RNA, also designated SEQ ID:3492.

[30464] Another function of VGAM781 is therefore inhibition of LOC148823 (Accession NM\_145278). Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 782 (VGAM782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30465] VGAM782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM782 was detected is described hereinabove with reference to Figs. 1–8.

[30466] VGAM782 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Deer Tick Virus.

VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30467] VGAM782 gene encodes a VGAM782 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM782 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM782 precursor RNA is designated SEQ ID:768, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:768 is located at position 4906 relative to the genome of Deer Tick Virus.

[30468] VGAM782 precursor RNA folds onto itself, forming VGAM782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30469] An enzyme complex designated DICER COMPLEX, `dices` the VGAM782 folded precursor RNA into VGAM782 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM782 RNA is designated SEQ ID:3493, and is provided hereinbelow with reference to the sequence listing part.

[30470] VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM782 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30471] VGAM782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM782 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30472] The complementary binding of VGAM782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM782 host tar-

get RNA into VGAM782 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30473] It is appreciated that VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM782 host target genes. The mRNA of each one of this plurality of VGAM782 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM782 RNA, herein designated VGAM RNA, and which when bound by VGAM782 RNA causes inhibition of translation of respective one or more VGAM782 host target proteins.

[30474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM782 gene, herein designated VGAM GENE, on one or more VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30475] It is yet further appreciated that a function of VGAM782 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of viral infection by Deer Tick Virus. Specific functions, and accordingly utilities, of VGAM782 correlate with, and may be deduced from, the identity of the host target genes which VGAM782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30476] Nucleotide sequences of the VGAM782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM782 are further

described hereinbelow with reference to Table 1.

[30477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM782 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30478] As mentioned hereinabove with reference to Fig. 1, a function of VGAM782 gene, herein designated VGAM is inhibition of expression of VGAM782 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM782 correlate with, and may be deduced from, the identity of the target genes which VGAM782 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30479] Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM\_004309) is a VGAM782 host target gene. ARHGDIA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGDIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ARHGDIA BINDING SITE, designated SEQ ID:10515, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30480] A function of VGAM782 is therefore inhibition of Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM\_004309), a gene which is a small guanine nucleotide exchange (GTP/GDP) factor. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIA. The function of ARHGDIA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435. Attractin (ATRN, Accession NM\_139321) is another VGAM782 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29298, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30481] Another function of VGAM782 is therefore inhibition of Attractin (ATRN, Accession NM\_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM\_005187) is another VGAM782 host target gene. CBFA2T3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11688, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30482] Another function of VGAM782 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2;

Translocated To, 3 (CBFA2T3, Accession NM\_005187). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. Centaurin, Delta 2 (CENTD2, Accession NM\_139181) is another VGAM782 host target gene. CENTD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CENTD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD2 BINDING SITE, designated SEQ ID:29196, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30483] Another function of VGAM782 is therefore inhibition of Centaurin, Delta 2 (CENTD2, Accession NM\_139181), a gene which involved in cell signaling/communication. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD2. The function of CENTD2 has been established by previous studies. Miura et al. (2002) examined ARAP1 as a possible link between phosphoinositide-, ARF-, and RHO-mediated cell signaling. In vitro, ARAP1

had RHO-GAP and phosphatidylinositol (3,4,5) trisphosphate (PIP3; OMIM Ref. No. 171834)-dependent ARF-GAP activity. ARAP1 associated with the Golgi. The RHO-GAP activity mediated cell rounding and loss of stress fibers when ARAP1 was overexpressed. The ARF-GAP activity mediated changes in the Golgi apparatus and the formation of filopodia, the latter a consequence of increased cellular activity of CDC42 (OMIM Ref. No. 116952). The ARF-GAP and RHO-GAP activities both contributed to inhibiting cell spreading. Thus, ARAP1 is a PIP3-dependent ARF-GAP that regulates ARF-, RHO-, and CDC42-dependent cell activities.

[30484] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30485] Miura, K.; Jacques, K. M.; Stauffer, S.; Kubosaki, A.; Zhu, K.; Hirsch, D. S.; Resau, J.; Zheng, Y.; Randazzo, P. A. : ARAP1: a point of convergence for Arf and Rho signaling. *Molec. Cell* 9: 109-119, 2002. ; and

[30486] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XI. The.

[30487] Further studies establishing the function and utilities of CENTD2 are found in John Hopkins OMIM database record ID 606646, and in cited publications numbered 612 and 7048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Discs, Large (Drosophila) Homolog 3 (neuroendocrine-dlg) (DLG3, Accession NM\_021120) is another VGAM782 host target gene. DLG3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG3 BINDING SITE, designated SEQ ID:22094, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30488] Another function of VGAM782 is therefore inhibition of Discs, Large (Drosophila) Homolog 3 (neuroendocrine-dlg) (DLG3, Accession NM\_021120), a gene which may interact with the cytoplasmic tail of the nmda receptor subunit nr2b . Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG3. The function of DLG3 has been established by previous studies. Mutations of the

'discs large' (dlg) tumor suppressor locus in *Drosophila* lead to imaginal disc neoplasia and a prolonged larval period followed by death. *Drosophila* dlg and related proteins form a subfamily of the membrane-associated guanylate kinase (MAGUK) protein family and are important components of specialized cell junctions. See DLG1 (OMIM Ref. No. 601014). By searching an EST database for sequences related to dlg and DLG1, Makino et al. (1997) isolated a partial cDNA encoding NEDLG (neuroendocrine DLG). Using PCR, they cloned a cDNA corresponding to the entire NEDLG coding region. The predicted 817-amino acid protein contains the 3 DHR (discs large homologous region) segments, central SH3 motif, and C-terminal guanylate kinase domain characteristic of MAGUK proteins. NEDLG shares 75% and 60% protein sequence identity with DLG1 and *Drosophila* dlg, respectively. Northern blot analysis revealed that NEDLG is highly expressed in neuronal and endocrine tissues. Immunolocalization studies indicated that the protein was expressed mainly in nonproliferating cells, such as neurons, cells in Langerhans islets of the pancreas, myocytes of heart muscles, and the prickle and functional layer cells of the esophageal epithelium. In a yeast 2-hybrid assay, NEDLG

interacted with the C-terminal region of the APC (OMIM Ref. No. 175100) tumor suppressor protein. The authors suggested that NEDLG may negatively regulate cell proliferation through its interaction with the APC protein.

[30489] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30490] Makino, K.; Kuwahara, H.; Masuko, N.; Nishiyama, Y.; Morisaki, T.; Sasaki, J.; Nakao, M.; Kuwano, A.; Nakata, M.; Ushio, Y.; Saya, H. : Cloning and characterization of NE-dlg: a novel human homolog of the Drosophila discs large (dlg) tumor suppressor protein interacts with the APC protein. *Oncogene* 14: 2425–2433, 1997. ; and

[30491] Stathakis, D. G.; Lee, D.; Bryant, P. J. : DLG3, the gene encoding human neuroendocrine Dlg (NE-Dlg), is located within the 1.8-Mb dystonia-parkinsonism region at Xq13.1. *Genomics* 49: 3.

[30492] Further studies establishing the function and utilities of DLG3 are found in John Hopkins OMIM database record ID 300189, and in cited publications numbered 11386–11387 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VII (serum prothrombin conver-

sion accelerator) (F7, Accession NM\_019616) is another VGAM782 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:21235 and SEQ ID:5606 respectively, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30493] Another function of VGAM782 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_019616). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. G Protein-coupled Receptor 56 (GPR56, Accession NM\_005682) is another VGAM782 host target gene. GPR56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GPR56 BINDING SITE, designated SEQ ID:12238, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30494] Another function of VGAM782 is therefore inhibition of G Protein-coupled Receptor 56 (GPR56, Accession NM\_005682), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR56. The function of GPR56 has been established by previous studies. G protein-coupled receptors (GPRs), which are characterized by the presence of 7 transmembrane domains, are divided into several classes based on sequence characteristics. Class B GPRs, or the secretin-like receptors, include the secretin receptor (OMIM Ref. No. 182098) and the calcitonin receptor (OMIM Ref. No. 114131). The orphan receptors HE6 (OMIM Ref. No. 602657), CD97 (OMIM Ref. No. 601211), EMR1 (OMIM Ref. No. 600493), and BAI1 (OMIM Ref. No. 602682) share significant homology with class B GPRs across the 7-transmembrane region, but have a distinct N-terminal region containing a characteristic cysteine box, which

precedes the first membrane-spanning domain, and a mucin-like domain. By PCR of human cDNAs with degenerate primers based on conserved regions from secretin-like receptors, Liu et al. (1999) isolated a cDNA encoding a novel receptor, which they designated GPR56. The predicted 693-amino acid GPR56 protein shares 26 to 32% sequence identity with the 4 class B-like orphan receptors. Like these receptors, GPR56 contains 7 transmembrane domains as well as a mucin-like domain and cysteine box in the N-terminal region. Northern blot analysis revealed that the GPR56 gene was expressed as a 3-kb mRNA in a wide range of tissues, with the highest levels in thyroid. Using in situ hybridization, Liu et al. (1999) determined that the GPR56 gene was expressed selectively within the monolayer of cuboidal epithelial cells of the smaller, more actively secreting follicles of human thyroid. The GPR56 gene contains 13 exons and spans approximately 15 kb. Using differential display, Zendman et al. (1999) identified a GPR56 cDNA as a transcript that was differentially expressed in melanoma cell lines with different metastatic potential. They designated the gene TM7XN1 (7-transmembrane protein with no EGF-like N-terminal domains-1) because the protein lacks the EGF-

like domains found in the related GPRs CD97 and EMR1. Zendman et al. (1999) reported that the TM7XN1 protein contains 687 amino acids. RT-PCR and Northern blot analyses indicated that TM7XN1 gene expression was inversely correlated with metastatic potential in melanoma cell lines.

[30495] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30496] Liu, M.; Parker, R. M. C.; Darby, K.; Eyre, H. J.; Copeland, N. G.; Crawford, J.; Gilbert, D. J.; Sutherland, G. R.; Jenkins, N. A.; Herzog, H. : GPR56, a novel secretin-like human G-protein-coupled receptor gene. *Genomics* 55: 296-305, 1999. ; and

[30498] Further studies establishing the function and utilities of GPR56 are found in John Hopkins OMIM database record ID 604110, and in cited publications numbered 7062-7063 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM\_008355) is another VGAM782 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30084, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30499] Another function of VGAM782 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM\_008355). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_078630) is another VGAM782 host target gene. MSL3L1 BINDING SITE1 and MSL3L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MSL3L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE1 and MSL3L1 BINDING SITE2, designated SEQ ID:27814 and SEQ ID:27815 respectively, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30500] Another function of VGAM782 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_078630). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. ADAR3 (Accession NM\_018702) is another VGAM782 host target gene. ADAR3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADAR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR3 BINDING SITE, designated SEQ ID:20786, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30501] Another function of VGAM782 is therefore inhibition of ADAR3 (Accession NM\_018702). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ADAR3. Chromosome 6 Open Reading Frame 9 (C6orf9, Accession NM\_022107) is another VGAM782 host target gene. C6orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf9 BINDING SITE, designated SEQ ID:22654, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30502] Another function of VGAM782 is therefore inhibition of Chromosome 6 Open Reading Frame 9 (C6orf9, Accession NM\_022107). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf9. Cadherin-like 22 (CDH22, Accession NM\_021248) is another VGAM782 host target gene. CDH22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of CDH22 BINDING SITE, designated SEQ ID:22214, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30503] Another function of VGAM782 is therefore inhibition of Cadherin-like 22 (CDH22, Accession NM\_021248). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH22. DKFZp547O146 (Accession NM\_020224) is another VGAM782 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21483, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30504] Another function of VGAM782 is therefore inhibition of DKFZp547O146 (Accession NM\_020224). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp547O146. Fatty Acid Desaturase 2 (FADS2, Accession NM\_004265) is another VGAM782 host target gene. FADS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FADS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS2 BINDING SITE, designated SEQ ID:10466, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30505] Another function of VGAM782 is therefore inhibition of Fatty Acid Desaturase 2 (FADS2, Accession NM\_004265). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS2. FLJ11320 (Accession NM\_018389) is another VGAM782 host target gene. FLJ11320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20427, to the

nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30506] Another function of VGAM782 is therefore inhibition of FLJ11320 (Accession NM\_018389). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ14351 (Accession NM\_024732) is another VGAM782 host target gene. FLJ14351 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14351 BINDING SITE, designated SEQ ID:24071, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30507] Another function of VGAM782 is therefore inhibition of FLJ14351 (Accession NM\_024732). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14351. FLJ14816 (Accession NM\_032845) is another VGAM782 host target gene. FLJ14816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ14816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14816 BINDING SITE, designated SEQ ID:26637, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30508] Another function of VGAM782 is therefore inhibition of FLJ14816 (Accession NM\_032845). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14816. Gamma-glutamyltransferase-like Activity 4 (GGTLA4, Accession NM\_080920) is another VGAM782 host target gene. GGTLA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GGTLA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGTLA4 BINDING SITE, designated SEQ ID:28141, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30509] Another function of VGAM782 is therefore inhibition of

Gamma-glutamyltransferase-like Activity 4 (GGTLA4, Accession NM\_080920). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGTLA4. KIAA0153 (Accession NM\_015140) is another VGAM782 host target gene. KIAA0153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0153 BINDING SITE, designated SEQ ID:17497, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30510] Another function of VGAM782 is therefore inhibition of KIAA0153 (Accession NM\_015140). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0153. KIAA0285 (Accession NM\_014807) is another VGAM782 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16751, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30511] Another function of VGAM782 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0298 (Accession XM\_084529) is another VGAM782 host target gene. KIAA0298 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:37625, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30512] Another function of VGAM782 is therefore inhibition of KIAA0298 (Accession XM\_084529). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0298. KIAA0376 (Accession XM\_037759) is another VGAM782 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32674, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30513] Another function of VGAM782 is therefore inhibition of KIAA0376 (Accession XM\_037759). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. KIAA0563 (Accession NM\_014834) is another VGAM782 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16842, to the nucleotide sequence of VGAM782 RNA, herein designated

VGAM RNA, also designated SEQ ID:3493.

[30514] Another function of VGAM782 is therefore inhibition of KIAA0563 (Accession NM\_014834). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. KIAA1076 (Accession XM\_037523) is another VGAM782 host target gene. KIAA1076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:32638, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30515] Another function of VGAM782 is therefore inhibition of KIAA1076 (Accession XM\_037523). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1076. KIAA1862 (Accession XM\_044212) is another VGAM782 host target gene. KIAA1862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1862, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1862 BINDING SITE, designated SEQ ID:34174, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30516] Another function of VGAM782 is therefore inhibition of KIAA1862 (Accession XM\_044212). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1862. Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM\_002356) is another VGAM782 host target gene. MARCKS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARCKS BINDING SITE, designated SEQ ID:8167, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30517] Another function of VGAM782 is therefore inhibition of Myristoylated Alanine-rich Protein Kinase C Substrate

(MARCKS, Accession NM\_002356). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARCKS. MGC4415 (Accession NM\_031484) is another VGAM782 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25567, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30518] Another function of VGAM782 is therefore inhibition of MGC4415 (Accession NM\_031484). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131) is another VGAM782 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9098, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30519] Another function of VGAM782 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. STRAIT11499 (Accession NM\_021242) is another VGAM782 host target gene. STRAIT11499 BINDING SITE1 and STRAIT11499 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STRAIT11499, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRAIT11499 BINDING SITE1 and STRAIT11499 BINDING SITE2, designated SEQ ID:22209 and SEQ ID:22210 respectively, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30520] Another function of VGAM782 is therefore inhibition of STRAIT11499 (Accession NM\_021242). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRAIT11499. LOC146562 (Accession NM\_139170) is another VGAM782 host target gene. LOC146562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146562 BINDING SITE, designated SEQ ID:29179, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30521] Another function of VGAM782 is therefore inhibition of LOC146562 (Accession NM\_139170). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146562. LOC158856 (Accession XM\_098998) is another VGAM782 host target gene. LOC158856 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158856, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158856 BINDING SITE, designated SEQ ID:42033, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30522] Another function of VGAM782 is therefore inhibition of LOC158856 (Accession XM\_098998). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158856. LOC201220 (Accession XM\_113321) is another VGAM782 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42225, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30523] Another function of VGAM782 is therefore inhibition of LOC201220 (Accession XM\_113321). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201220. LOC254057 (Accession XM\_173085) is another VGAM782 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46342, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30524] Another function of VGAM782 is therefore inhibition of LOC254057 (Accession XM\_173085). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC254205 (Accession XM\_172962) is another VGAM782 host target gene. LOC254205 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254205 BINDING SITE, designated SEQ ID:46217, to the nucleotide sequence of VGAM782 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3493.

[30525] Another function of VGAM782 is therefore inhibition of LOC254205 (Accession XM\_172962). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254205. LOC92340 (Accession XM\_044426) is another VGAM782 host target gene. LOC92340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92340 BINDING SITE, designated SEQ ID:34199, to the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, also designated SEQ ID:3493.

[30526] Another function of VGAM782 is therefore inhibition of LOC92340 (Accession XM\_044426). Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92340. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 783 (VGAM783) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30527] VGAM783 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM783 was detected is described hereinabove with reference to Figs. 1–8.

[30528] VGAM783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Deer Tick Virus. VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30529] VGAM783 gene encodes a VGAM783 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM783 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM783 precursor RNA is designated SEQ ID:769, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:769 is located at position 1240 relative to the genome of Deer Tick Virus.

[30530] VGAM783 precursor RNA folds onto itself, forming

VGAM783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM783 folded precursor RNA into VGAM783 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM783 RNA is designated SEQ ID:3494, and is provided hereinbelow with reference to the sequence listing part.

[30532] VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM783 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30533] VGAM783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM783 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM783 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30534] The complementary binding of VGAM783 RNA, herein designated VGAM RNA, to host target binding sites on VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM783 host target RNA into VGAM783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30535] It is appreciated that VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM783 host target genes. The mRNA of each one of this plurality of VGAM783 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM783 RNA, herein designated VGAM RNA, and which when bound by VGAM783 RNA causes inhibition of translation of respective one or more VGAM783 host target proteins.

[30536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM783 gene, herein designated VGAM GENE, on one or more VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30537] It is yet further appreciated that a function of VGAM783 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of viral infection by Deer Tick Virus. Specific functions, and accordingly utilities, of VGAM783 correlate with, and may be deduced from, the identity of the host target genes which VGAM783 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[30538] Nucleotide sequences of the VGAM783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM783 are further described hereinbelow with reference to Table 1.

[30539] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM783 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30540] As mentioned hereinabove with reference to Fig. 1, a function of VGAM783 gene, herein designated VGAM is inhibition of expression of VGAM783 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM783 correlate with, and may be deduced from, the identity of the target genes which VGAM783 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[30541] MGC15429 (Accession NM\_032750) is a VGAM783 host target gene. MGC15429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15429 BINDING SITE, designated SEQ ID:26487, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30542] A function of VGAM783 is therefore inhibition of MGC15429 (Accession NM\_032750). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15429. Phospholipid Scramblase 4 (PLSCR4, Accession NM\_020353) is another VGAM783 host target gene. PLSCR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLSCR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR4 BINDING SITE, designated SEQ

ID:21622, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30543] Another function of VGAM783 is therefore inhibition of Phospholipid Scramblase 4 (PLSCR4, Accession NM\_020353). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR4. Regulator of G-protein Signalling 18 (RGS18, Accession NM\_130782) is another VGAM783 host target gene. RGS18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS18 BINDING SITE, designated SEQ ID:28270, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30544] Another function of VGAM783 is therefore inhibition of Regulator of G-protein Signalling 18 (RGS18, Accession NM\_130782). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS18. LOC122553

(Accession XM\_058630) is another VGAM783 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36692, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30545] Another function of VGAM783 is therefore inhibition of LOC122553 (Accession XM\_058630). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC148195 (Accession XM\_097419) is another VGAM783 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40880, to the nucleotide sequence of VGAM783 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3494.

[30546] Another function of VGAM783 is therefore inhibition of LOC148195 (Accession XM\_097419). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC166341 (Accession XM\_093804) is another VGAM783 host target gene. LOC166341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC166341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166341 BINDING SITE, designated SEQ ID:40213, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30547] Another function of VGAM783 is therefore inhibition of LOC166341 (Accession XM\_093804). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166341. LOC254532 (Accession XM\_172961) is another VGAM783 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254532, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46216, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30548] Another function of VGAM783 is therefore inhibition of LOC254532 (Accession XM\_172961). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC257319 (Accession XM\_171049) is another VGAM783 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45836, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30549] Another function of VGAM783 is therefore inhibition of LOC257319 (Accession XM\_171049). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257319. LOC51289 (Accession NM\_016568) is another VGAM783 host target gene. LOC51289 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51289 BINDING SITE, designated SEQ ID:18640, to the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, also designated SEQ ID:3494.

[30550] Another function of VGAM783 is therefore inhibition of LOC51289 (Accession NM\_016568). Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51289. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 784 (VGAM784) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30551] VGAM784 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM784 was detected is described hereinabove with reference to Figs. 1–8.

[30552] VGAM784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Deer Tick Virus.

VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30553] VGAM784 gene encodes a VGAM784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM784 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM784 precursor RNA is designated SEQ ID:770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:770 is located at position 834 relative to the genome of Deer Tick Virus.

[30554] VGAM784 precursor RNA folds onto itself, forming VGAM784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30555] An enzyme complex designated DICER COMPLEX, `dices` the VGAM784 folded precursor RNA into VGAM784 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM784 RNA is designated SEQ ID:3495, and is provided hereinbelow with reference to the sequence listing part.

[30556] VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM784 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30557] VGAM784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM784 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM784 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30558] The complementary binding of VGAM784 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM784 host target RNA into VGAM784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30559] It is appreciated that VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM784 host target genes. The mRNA of each one of this plurality of VGAM784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM784 RNA, herein designated VGAM RNA, and which when bound by VGAM784 RNA causes inhibition of translation of respective one or more VGAM784 host target proteins.

[30560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM784 gene, herein designated VGAM GENE, on one or more VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30561] It is yet further appreciated that a function of VGAM784 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of viral infection by Deer Tick Virus. Specific functions, and accordingly utilities, of VGAM784 correlate with, and may be deduced from, the identity of the host target genes which VGAM784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30562] Nucleotide sequences of the VGAM784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM784 are further described hereinbelow with reference to Table 1.

[30563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM784 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30564] As mentioned hereinabove with reference to Fig. 1, a function of VGAM784 gene, herein designated VGAM is inhibition of expression of VGAM784 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM784 correlate with, and may be deduced from, the identity of the target genes which VGAM784 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30565] Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205) is a VGAM784 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22181, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30566] A function of VGAM784 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205). Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. Chromosome 20 Open Reading Frame 42 (C20orf42, Accession NM\_017671) is another VGAM784 host target gene. C20orf42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf42 BINDING SITE, designated SEQ ID:19213, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30567] Another function of VGAM784 is therefore inhibition of Chromosome 20 Open Reading Frame 42 (C20orf42, Accession NM\_017671). Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf42. DKFZp761D0614 (Accession XM\_113634) is another VGAM784 host target gene. DKFZp761D0614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D0614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D0614 BINDING SITE, designated SEQ ID:42309, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30568] Another function of VGAM784 is therefore inhibition of DKFZp761D0614 (Accession XM\_113634). Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D0614. KIAA1228 (Accession XM\_036408) is another VGAM784 host target gene. KIAA1228 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by KIAA1228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1228 BINDING SITE, designated SEQ ID:32442, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30569] Another function of VGAM784 is therefore inhibition of KIAA1228 (Accession XM\_036408). Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1228. LOC200473 (Accession XM\_117237) is another VGAM784 host target gene. LOC200473 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200473 BINDING SITE, designated SEQ ID:43312, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30570] Another function of VGAM784 is therefore inhibition of LOC200473 (Accession XM\_117237). Accordingly, utilities

of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200473. LOC221296 (Accession XM\_166325) is another VGAM784 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221296 BINDING SITE, designated SEQ ID:44170, to the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, also designated SEQ ID:3495.

[30571] Another function of VGAM784 is therefore inhibition of LOC221296 (Accession XM\_166325). Accordingly, utilities of VGAM784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221296. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 785 (VGAM785) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30572] VGAM785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM785 was detected is described hereinabove with reference to Figs. 1–8.

[30573] VGAM785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini Yellow Mosaic Virus. VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30574] VGAM785 gene encodes a VGAM785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM785 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM785 precursor RNA is designated SEQ ID:771, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:771 is located at position 7220 relative to the genome of Zucchini Yellow Mosaic Virus.

[30575] VGAM785 precursor RNA folds onto itself, forming VGAM785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30576] An enzyme complex designated DICER COMPLEX, `dices` the VGAM785 folded precursor RNA into VGAM785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM785 RNA is designated SEQ ID:3496, and is provided hereinbelow with reference to the sequence listing part.

[30577] VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM785 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[30578] VGAM785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM785 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM785 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30579] The complementary binding of VGAM785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM785 host target RNA into VGAM785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30580] It is appreciated that VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM785 host target genes. The mRNA of each one of this plurality of VGAM785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM785 RNA, herein designated VGAM RNA, and which when bound by VGAM785 RNA causes inhibition of translation of respective one or more VGAM785 host target proteins.

[30581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM785 gene, herein designated VGAM GENE, on one or more VGAM785 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30582] It is yet further appreciated that a function of VGAM785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM785 include diagnosis, prevention and treatment of viral infection by Zucchini Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM785 correlate with, and may be deduced from, the identity of the host target genes which VGAM785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30583] Nucleotide sequences of the VGAM785 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM785 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM785 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM785 are further  
described hereinbelow with reference to Table 1.

[30584] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM785 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM785 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[30585] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM785 gene, herein designated VGAM is  
inhibition of expression of VGAM785 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM785 correlate with, and may be deduced  
from, the identity of the target genes which VGAM785  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[30586] Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184) is a VGAM785 host target gene. CALM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALM3 BINDING SITE, designated SEQ ID:11682, to the nucleotide sequence of VGAM785 RNA, herein designated VGAM RNA, also designated SEQ ID:3496.

[30587] A function of VGAM785 is therefore inhibition of Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184), a gene which mediates the control of a large number of enzymes by  $Ca^{++}$ . Accordingly, utilities of VGAM785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM3. The function of CALM3 has been established by previous studies. McPherson et al. (1991) assigned the CALM3 gene to chromosome 19 by study of somatic cell hybrids. By PCR-based amplification of CALM3-specific sequences using DNA from human/hamster cell hybrids as template, Berchtold et al. (1993) confirmed the assignment to chro-

mosome 19 and regionalized the gene to 19q13.2–q13.3 by in situ hybridization.

[30588] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30589] Berchtold, M. W.; Egli, R.; Rhyner, J. A.; Hameister, H.; Strehler, E. E. : Localization of the human bona fide calmodulin genes CALM1, CALM2, and CALM3 to chromosomes 14q24–q31, 2p21.1–p21.3, and 19q13.2–q13.3. Genomics 16: 461–465, 1993. ; and

[30590] McPherson, J. D.; Hickie, R. A.; Wasmuth, J. J.; Meyskens, F. L.; Perham, R. N.; Strehler, E. E.; Graham, M. T. : Chromosomal localization of multiple genes encoding calmodulin. (Abstra.

[30591] Further studies establishing the function and utilities of CALM3 are found in John Hopkins OMIM database record ID 114183, and in cited publications numbered 1257 and 12578 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LFG (Accession XM\_084780) is another VGAM785 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37691, to the nucleotide sequence of VGAM785 RNA, herein designated VGAM RNA, also designated SEQ ID:3496.

[30592] Another function of VGAM785 is therefore inhibition of LFG (Accession XM\_084780). Accordingly, utilities of VGAM785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. FLJ22029 (Accession NM\_024949) is another VGAM785 host target gene. FLJ22029 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22029 BINDING SITE, designated SEQ ID:24504, to the nucleotide sequence of VGAM785 RNA, herein designated VGAM RNA, also designated SEQ ID:3496.

[30593] Another function of VGAM785 is therefore inhibition of FLJ22029 (Accession NM\_024949). Accordingly, utilities of VGAM785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22029.

SSH2 (Accession XM\_030846) is another VGAM785 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31178, to the nucleotide sequence of VGAM785 RNA, herein designated VGAM RNA, also designated SEQ ID:3496.

[30594] Another function of VGAM785 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 786 (VGAM786) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30595] VGAM786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM786 was detected is described

hereinabove with reference to Figs. 1–8.

[30596] VGAM786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini Yellow Mosaic Virus. VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30597] VGAM786 gene encodes a VGAM786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM786 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM786 precursor RNA is designated SEQ ID:772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:772 is located at position 8631 relative to the genome of Zucchini Yellow Mosaic Virus.

[30598] VGAM786 precursor RNA folds onto itself, forming VGAM786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30599] An enzyme complex designated DICER COMPLEX, `dices` the VGAM786 folded precursor RNA into VGAM786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM786 RNA is designated SEQ ID:3497, and is provided hereinbelow with reference to the sequence listing part.

[30600] VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM786 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30601] VGAM786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM786 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM786 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30602] The complementary binding of VGAM786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM786 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM786 host target RNA into VGAM786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30603] It is appreciated that VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM786 host target genes. The mRNA of each one of this plurality of VGAM786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM786 RNA, herein designated VGAM RNA, and which when bound by VGAM786 RNA causes inhibition of translation of respective one or more VGAM786 host target proteins.

[30604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM786 gene, herein designated VGAM GENE, on one or more VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30605] It is yet further appreciated that a function of VGAM786 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of viral infection by Zucchini Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM786 correlate with, and may be deduced from, the identity of the host target genes which VGAM786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30606] Nucleotide sequences of the VGAM786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM786 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM786 are further described hereinbelow with reference to Table 1.

[30607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM786 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30608] As mentioned hereinabove with reference to Fig. 1, a function of VGAM786 gene, herein designated VGAM is inhibition of expression of VGAM786 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM786 correlate with, and may be deduced from, the identity of the target genes which VGAM786 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30609] Aristaless-like Homeobox 3 (ALX3, Accession NM\_006492) is a VGAM786 host target gene. ALX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALX3, corresponding to a HOST TARGET binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALX3 BINDING SITE, designated SEQ ID:13220, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30610] A function of VGAM786 is therefore inhibition of Arista-less-like Homeobox 3 (ALX3, Accession NM\_006492), a gene which is involved in cell-type differentiation and development. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALX3. The function of ALX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Asparagine Synthetase (ASNS, Accession NM\_133436) is another VGAM786 host target gene. ASNS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ASNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASNS BINDING SITE, designated SEQ ID:28515, to the nucleotide sequence of VGAM786 RNA, herein designated

VGAM RNA, also designated SEQ ID:3497.

[30611] Another function of VGAM786 is therefore inhibition of Asparagine Synthetase (ASNS, Accession NM\_133436). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASNS. Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978) is another VGAM786 host target gene. EPB49 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB49 BINDING SITE, designated SEQ ID:7708, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30612] Another function of VGAM786 is therefore inhibition of Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978), a gene which is an actin-bundling protein. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB49. The function of EPB49 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to

VGAM760.Fibroblast Growth Factor Receptor 2

(bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM\_000141) is another VGAM786 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:5638, SEQ ID:23300, SEQ ID:23234, SEQ ID:23241, SEQ ID:23288 and SEQ ID:23294 respectively, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30613] Another function of VGAM786 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM\_000141).

Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2. Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838) is another VGAM786 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6496, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30614] Another function of VGAM786 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 has been established by previous studies. Stephan et al. (1996) isolated 2 splice variants of mGluR1 from a human cerebellum cDNA library. The 3.3- and 5.6-kb clones encoded mGluR1-beta and mGluR1-alpha, respectively.

Northern blot analysis showed that mGluR1 mRNA was expressed in the highest levels in the cerebellum, followed by cerebral cortex, thalamus, subthalamic nucleus, and amygdala. Lower levels were also detected in the hippocampus, substantia nigra, caudate nucleus, and putamen. Little or no mRNA was detected in spinal cord or corpus callosum. Animal model experiments lend further support to the function of GRM1. Aiba et al. (1994) generated a mouse strain deficient in GluR1 by targeted disruption. Gross anatomy of the hippocampus, excitatory synaptic transmission, long-term depression, and short-term potentiation in the hippocampal CA1 region were all apparently normal in the mutant mice. In contrast, long-term potentiation was substantially reduced, and a moderate level of impairment was observed in context-specific associative learning. Aiba et al. (1994) proposed that GluR1 is not 'in line' in long-term potentiation production, but rather modulates the plasticity process, and hence affects context-specific associative learning. Aiba et al. (1994) found that the GluR1 mutant mice were viable but showed characteristic cerebellar symptoms, such as ataxic gait and intention tremor. The anatomy of the cerebellum was not overtly disturbed. Excitatory synaptic transmis-

sion from parallel fibers to Purkinje cells and that from climbing fibers to Purkinje cells appeared to be functional, and voltage-gated calcium channels of Purkinje cells were normal. Both parallel fibers and climbing fiber synapses displayed normal short-term synaptic plasticity to paired stimuli. By marked contrast, long-term depression was clearly deficient and conditioned eyeblink response was impaired. Aiba et al. (1994) concluded that GluR1 was required for the induction of long-term depression.

[30615] It is appreciated that the abovementioned animal model for GRM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[30616] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30617] Aiba, A.; Chen, C.; Herrup, K.; Rosenmund, C.; Stevens, C. F.; Tonegawa, S. : Reduced hippocampal long-term potentiation and context-specific deficit in associative learning in mGluR1 mutant mice. Cell 79: 365-375, 1994. ; and

[30618] Stephan, D.; Bon, C.; Holzwarth, J. A.; Galvan, M.; Pruss, R. M. : Human metabotropic glutamate receptor 1: mRNA

distribution, chromosome localization and functional expression of two.

[30619] Further studies establishing the function and utilities of GRM1 are found in John Hopkins OMIM database record ID 604473, and in cited publications numbered 4924–4925, 7056–493 and 4920 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216) is another VGAM786 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:5717, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30620] Another function of VGAM786 is therefore inhibition of Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession

NM\_002417) is another VGAM786 host target gene.

MKI67 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKI67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKI67 BINDING SITE, designated SEQ ID:8254, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30621] Another function of VGAM786 is therefore inhibition of Antigen Identified By Monoclonal Antibody Ki-67 (MKI67, Accession NM\_002417), a gene which thought to be required for maintaining cell proliferation. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKI67. The function of MKI67 has been established by previous studies. Ki-67 is a commercially available monoclonal antibody that reacts with a nuclear antigen expressed in proliferating cells but not in quiescent cells. Expression of this antigen occurs preferentially during late G1, S, G2, and M phases of the cell cycle, while in cells in G0 phase the antigen cannot be detected. Consequently, the antibody is used in tumor pathology to detect proliferating cells.

erating cells in neoplastic diseases. In cultured cells an antigen in the nucleolus of interphase cells stains with Ki-67, which, furthermore, reacts with an interchromatinous network during mitosis. From study of a panel of human-rodent somatic cell hybrids, Schonk et al. (1989) demonstrated that a gene involved in the expression of the antigen is located on chromosome 10. By in situ hybridization, Fonatsch et al. (1991) regionalized the MKI67 gene to 10q25-qter. By FISH, Traut et al. (1998) mapped the mouse Mki67 gene to chromosome 7F3-F5. By immunoscreening a cDNA expression library, followed by RT-PCR and 5-prime and 3-prime RACE, Schluter et al. (1993) isolated 2 cDNAs encoding isoforms of Ki-67. Genomic sequence analysis determined that the Ki-67 gene contains 15 exons. The Ki-67 repeat region, within which there is a 22-amino acid Ki-67 motif, is encoded by exon 13. The shorter isoform lacks exon 7. Northern blot analysis revealed multiple transcripts ranging from approximately 8.9 to 12.5 kb in proliferating but not quiescent cells. Immunoblot analysis showed expression of 320- and 359-kD proteins. Sequence analysis predicted that the short-lived 2,896- and 3,256-amino acid protein isoforms contain potential nuclear targeting signals, over

200 potential phosphorylation sites, 19 N-myristoylation sites, 3 amidation sites, and numerous PEST sites. Anti-sense oligonucleotides inhibited cellular proliferation in a dose-dependent manner, suggesting that Ki-67 protein expression may be an absolute requirement for cell proliferation.

[30622] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30623] Schluter, C.; Duchrow, M.; Wohlenberg, C.; Becker, M. H. G.; Key, G.; Flad, H.-D.; Gerdes, J. : The cell proliferation-associated antigen of antibody Ki-67: a very large, ubiquitous nuclear protein with numerous repeated elements, representing a new kind of cell cycle-maintaining proteins. J. Cell. Biol. 123: 513-522, 1993. ; and

[30624] Traut, W.; Scholzen, T.; Winking, H.; Kubbutat, M. H. G.; Gerdes, J. : Assignment of the murine Ki-67 gene (Mki67) to chromosome band 7F3-F5 by in situ hybridization. Cytogenet. Cell Ge.

[30625] Further studies establishing the function and utilities of MKI67 are found in John Hopkins OMIM database record ID 176741, and in cited publications numbered 1794-1797 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade H (heat shock protein 47), Member 2 (SERPINH2, Accession NM\_001235) is another VGAM786 host target gene. SERPINH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINH2 BINDING SITE, designated SEQ ID:6905, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30626] Another function of VGAM786 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade H (heat shock protein 47), Member 2 (SERPINH2, Accession NM\_001235), a gene which binds to collagen. could be involved as a chaperone in the biosynthetic pathway of collagen. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINH2. The function of SERPINH2 has been established by previous studies. Collagen-binding proteins, or colligins, are glycoproteins localized to endoplasmic reticulum that belong to the serpin

(serine protease inhibitor) family. Ikegawa et al. (1995) isolated and characterized a full-length human cDNA clone that encodes a 418-amino acid peptide highly homologous (97% identity) to the human colligin-1 gene (OMIM Ref. No. 600942) previously reported by Clarke and Sanwal (1992). Ikegawa et al. (1995) called the novel gene colligin-2 and identified a genomic clone that contained the entire coding sequence of the cDNA. By fluorescence in situ hybridization they determined its chromosomal localization on 11q13.5. The authors found that the colligin-2 gene is expressed ubiquitously among all normal human tissues except brain and circulating leukocytes. Ikegawa and Nakamura (1997) found that the CBP2 gene spans approximately 11 kb of genomic DNA and consists of 5 exons. The promoter sequence of the human gene shows significant homology to that of its murine counterpart, which contains several regulatory sequences including heat-shock and retinoic acid-responsive elements. The findings suggested that colligin may function as a collagen-specific molecular chaperone and play a role in the process of retinoic acid-induced differentiation.

[30627] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[30628] Ikegawa, S.; Sudo, K.; Okui, K.; Nakamura, Y. : Isolation, characterization and chromosomal assignment of human colligin-2 gene (CBP2). Cytogenet. Cell Genet. 71: 182-186, 1995. ; and

[30629] Ikegawa, S.; Sudo, K.; Okui, K.; Nakamura, Y. : Isolation, characterization and chromosomal assignment of human colligin-2 gene (CBP2). Cytogenet. Cell Genet. 71: 182-186, 1995.

[30630] Further studies establishing the function and utilities of SERPINH2 are found in John Hopkins OMIM database record ID 600943, and in cited publications numbered 1288-1290 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434O125 (Accession XM\_036284) is another VGAM786 host target gene. DKFZP434O125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434O125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O125 BINDING SITE, designated SEQ ID:32404, to the nucleotide sequence of VGAM786 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3497.

[30631] Another function of VGAM786 is therefore inhibition of DKFZP434O125 (Accession XM\_036284). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O125. Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM\_027569) is another VGAM786 host target gene. DMWD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMWD BINDING SITE, designated SEQ ID:30527, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30632] Another function of VGAM786 is therefore inhibition of Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM\_027569). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMWD. FLJ14106 (Accession NM\_025067) is another VGAM786 host target gene. FLJ14106 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ14106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:24664, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30633] Another function of VGAM786 is therefore inhibition of FLJ14106 (Accession NM\_025067). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106. FLJ20202 (Accession NM\_017709) is another VGAM786 host target gene. FLJ20202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20202 BINDING SITE, designated SEQ ID:19288, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30634] Another function of VGAM786 is therefore inhibition of

FLJ20202 (Accession NM\_017709). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20202. FLJ20255 (Accession NM\_017728) is another VGAM786 host target gene. FLJ20255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20255 BINDING SITE, designated SEQ ID:19317, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30635] Another function of VGAM786 is therefore inhibition of FLJ20255 (Accession NM\_017728). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20255. KIAA0426 (Accession NM\_014724) is another VGAM786 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16311, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30636] Another function of VGAM786 is therefore inhibition of KIAA0426 (Accession NM\_014724). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. LEC3 (Accession NM\_015236) is another VGAM786 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17568, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30637] Another function of VGAM786 is therefore inhibition of LEC3 (Accession NM\_015236). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. MGC16384 (Accession NM\_053048) is another VGAM786

host target gene. MGC16384 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC16384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16384 BINDING SITE, designated SEQ ID:27594, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30638] Another function of VGAM786 is therefore inhibition of MGC16384 (Accession NM\_053048). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16384. NDP52 (Accession NM\_005831) is another VGAM786 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12441, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30639] Another function of VGAM786 is therefore inhibition of NDP52 (Accession NM\_005831). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP52. SCMH1 (Accession NM\_012236) is another VGAM786 host target gene. SCMH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCMH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCMH1 BINDING SITE, designated SEQ ID:14538, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30640] Another function of VGAM786 is therefore inhibition of SCMH1 (Accession NM\_012236). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCMH1. Serine (or cysteine) Proteinase Inhibitor, Clade H (heat shock protein 47), Member 1, (collagen binding protein 1) (SERPINH1, Accession NM\_004353) is another VGAM786 host target gene. SERPINH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by SERPINH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINH1 BINDING SITE, designated SEQ ID:10559, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30641] Another function of VGAM786 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade H (heat shock protein 47), Member 1, (collagen binding protein 1) (SERPINH1, Accession NM\_004353). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINH1. Zinc Finger Protein 317 (ZNF317, Accession XM\_050435) is another VGAM786 host target gene. ZNF317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF317 BINDING SITE, designated SEQ ID:35637, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ

ID:3497.

[30642] Another function of VGAM786 is therefore inhibition of Zinc Finger Protein 317 (ZNF317, Accession XM\_050435). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF317. LOC201229 (Accession XM\_113925) is another VGAM786 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42538, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30643] Another function of VGAM786 is therefore inhibition of LOC201229 (Accession XM\_113925). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC201799 (Accession XM\_114380) is another VGAM786 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42915, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30644] Another function of VGAM786 is therefore inhibition of LOC201799 (Accession XM\_114380). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. LOC221272 (Accession XM\_168050) is another VGAM786 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:44962, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30645] Another function of VGAM786 is therefore inhibition of LOC221272 (Accession XM\_168050). Accordingly, utilities

of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC91056 (Accession XM\_170662) is another VGAM786 host target gene. LOC91056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91056 BINDING SITE, designated SEQ ID:45439, to the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, also designated SEQ ID:3497.

[30646] Another function of VGAM786 is therefore inhibition of LOC91056 (Accession XM\_170662). Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91056. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 787 (VGAM787) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30647] VGAM787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM787 was detected is described hereinabove with reference to Figs. 1–8.

[30648] VGAM787 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini Yellow Mosaic Virus. VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30649] VGAM787 gene encodes a VGAM787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM787 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM787 precursor RNA is designated SEQ ID:773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:773 is located at position 3152 relative to the genome of Zucchini Yellow Mosaic Virus.

[30650] VGAM787 precursor RNA folds onto itself, forming VGAM787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30651] An enzyme complex designated DICER COMPLEX, `dices` the VGAM787 folded precursor RNA into VGAM787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM787 RNA is designated SEQ ID:3498, and is provided hereinbelow with reference to the sequence listing part.

[30652] VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM787 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[30653] VGAM787 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM787 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30654] The complementary binding of VGAM787 RNA, herein designated VGAM RNA, to host target binding sites on VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM787 host target RNA into VGAM787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30655] It is appreciated that VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM787 host target genes. The mRNA of each one of this plurality of VGAM787 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM787 RNA, herein designated VGAM RNA, and which when bound by VGAM787 RNA causes inhibition of translation of respective one or more VGAM787 host target proteins.

[30656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM787 gene, herein designated VGAM GENE, on one or more VGAM787 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30657] It is yet further appreciated that a function of VGAM787 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of viral infection by Zucchini Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM787 correlate with, and may be deduced from, the identity of the host target genes which VGAM787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30658] Nucleotide sequences of the VGAM787 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM787 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM787 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM787 are further  
described hereinbelow with reference to Table 1.

[30659] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM787 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM787 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[30660] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM787 gene, herein designated VGAM is  
inhibition of expression of VGAM787 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM787 correlate with, and may be deduced  
from, the identity of the target genes which VGAM787  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[30661] Chloride Channel 4 (CLCN4, Accession NM\_001830) is a  
VGAM787 host target gene. CLCN4 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:7571, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30662] A function of VGAM787 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM\_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM\_004709) is another VGAM787 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11055, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30663] Another function of VGAM787 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM\_004709). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM\_005513) is another VGAM787 host target gene. GTF2E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2E1 BINDING SITE, designated SEQ ID:12038, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30664] Another function of VGAM787 is therefore inhibition of General Transcription Factor IIE, Polypeptide 1, Alpha

56kDa (GTF2E1, Accession NM\_005513). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1. MADP-1 (Accession NM\_033114) is another VGAM787 host target gene. MADP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADP-1 BINDING SITE, designated SEQ ID:26962, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30665] Another function of VGAM787 is therefore inhibition of MADP-1 (Accession NM\_033114). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADP-1. LOC120856 (Accession XM\_058509) is another VGAM787 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36637, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30666] Another function of VGAM787 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC152756 (Accession XM\_098262) is another VGAM787 host target gene. LOC152756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:41548, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30667] Another function of VGAM787 is therefore inhibition of LOC152756 (Accession XM\_098262). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. LOC157931 (Accession XM\_098845) is an-

other VGAM787 host target gene. LOC157931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:41904, to the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, also designated SEQ ID:3498.

[30668] Another function of VGAM787 is therefore inhibition of LOC157931 (Accession XM\_098845). Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157931. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 788 (VGAM788) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30669] VGAM788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM788 was detected is described

hereinabove with reference to Figs. 1–8.

[30670] VGAM788 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini Yellow Mosaic Virus. VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30671] VGAM788 gene encodes a VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM788 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM788 precursor RNA is designated SEQ ID:774, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:774 is located at position 2523 relative to the genome of Zucchini Yellow Mosaic Virus.

[30672] VGAM788 precursor RNA folds onto itself, forming VGAM788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM788 folded precursor RNA into VGAM788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM788 RNA is designated SEQ ID:3499, and is provided hereinbelow with reference to the sequence listing part.

[30674] VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM788 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30675] VGAM788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM788 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30676] The complementary binding of VGAM788 RNA, herein designated VGAM RNA, to host target binding sites on VGAM788 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM788 host target RNA into VGAM788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30677] It is appreciated that VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM788 host target genes. The mRNA of each one of this plurality of VGAM788 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM788 RNA, herein designated VGAM RNA, and which when bound by VGAM788 RNA causes inhibition of translation of respective one or more VGAM788 host target proteins.

[30678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM788 gene, herein designated VGAM GENE, on one or more VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30679] It is yet further appreciated that a function of VGAM788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM788 include diagnosis, prevention and treatment of viral infection by Zucchini Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM788 correlate with, and may be deduced from, the identity of the host target genes which VGAM788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30680] Nucleotide sequences of the VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM788 are further described hereinbelow with reference to Table 1.

[30681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM788 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM788 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM788 gene, herein designated VGAM is inhibition of expression of VGAM788 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM788 correlate with, and may be deduced from, the identity of the target genes which VGAM788 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30683] FLJ10178 (Accession NM\_018015) is a VGAM788 host target gene. FLJ10178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10178 BINDING SITE, designated SEQ ID:19753, to the nucleotide sequence of VGAM788 RNA, herein designated VGAM RNA, also designated SEQ ID:3499.

[30684] A function of VGAM788 is therefore inhibition of FLJ10178 (Accession NM\_018015). Accordingly, utilities of VGAM788 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10178. FLJ12681 (Accession NM\_022773) is another VGAM788 host target gene. FLJ12681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12681 BINDING SITE, designated SEQ ID:23036, to the nucleotide sequence of VGAM788 RNA, herein designated VGAM RNA, also designated SEQ ID:3499.

[30685] Another function of VGAM788 is therefore inhibition of FLJ12681 (Accession NM\_022773). Accordingly, utilities of VGAM788 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12681.

FLJ32865 (Accession NM\_144613) is another VGAM788 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29430, to the nucleotide sequence of VGAM788 RNA, herein designated VGAM RNA, also designated SEQ ID:3499.

[30686] Another function of VGAM788 is therefore inhibition of FLJ32865 (Accession NM\_144613). Accordingly, utilities of VGAM788 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 789 (VGAM789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30687] VGAM789 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM789 was detected is described

hereinabove with reference to Figs. 1–8.

[30688] VGAM789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30689] VGAM789 gene encodes a VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM789 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM789 precursor RNA is designated SEQ ID:775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:775 is located at position 4478 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30690] VGAM789 precursor RNA folds onto itself, forming VGAM789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[30691] An enzyme complex designated DICER COMPLEX, `dices` the VGAM789 folded precursor RNA into VGAM789 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM789 RNA is designated SEQ ID:3500, and is provided hereinbelow with reference to the sequence listing part.

[30692] VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM789 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30693] VGAM789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM789 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30694] The complementary binding of VGAM789 RNA, herein designated VGAM RNA, to host target binding sites on VGAM789 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM789 host target RNA into VGAM789 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30695] It is appreciated that VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM789 host target genes. The mRNA of each one of this plurality of VGAM789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM789 RNA, herein designated VGAM RNA, and which when bound by VGAM789 RNA causes inhibition of translation of respective one or more VGAM789 host target proteins.

[30696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM789 gene, herein designated VGAM GENE, on one or more VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30697] It is yet further appreciated that a function of VGAM789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM789 correlate with, and may be deduced from, the identity of the host target genes which VGAM789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30698] Nucleotide sequences of the VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM789 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM789 are further described hereinbelow with reference to Table 1.

[30699] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM789 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30700] As mentioned hereinabove with reference to Fig. 1, a function of VGAM789 gene, herein designated VGAM is inhibition of expression of VGAM789 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM789 correlate with, and may be deduced from, the identity of the target genes which VGAM789 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30701] Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM\_006373) is a VGAM789 host target gene. VAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

VAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAT1 BINDING SITE, designated SEQ ID:13066, to the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, also designated SEQ ID:3500.

[30702] A function of VGAM789 is therefore inhibition of Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM\_006373), a gene which is a membrane protein of cholinergic synaptic vesicles. Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAT1. The function of VAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM212. Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698) is another VGAM789 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ

ID:13523, to the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, also designated SEQ ID:3500.

[30703] Another function of VGAM789 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698). Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. LOC152790 (Accession XM\_098264) is another VGAM789 host target gene. LOC152790 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152790 BINDING SITE, designated SEQ ID:41554, to the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, also designated SEQ ID:3500.

[30704] Another function of VGAM789 is therefore inhibition of LOC152790 (Accession XM\_098264). Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152790. LOC162333 (Accession XM\_102591) is an-

other VGAM789 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42121, to the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, also designated SEQ ID:3500.

[30705] Another function of VGAM789 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC202126 (Accession XM\_117362) is another VGAM789 host target gene. LOC202126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202126 BINDING SITE, designated SEQ ID:43412, to the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, also designated SEQ ID:3500.

[30706] Another function of VGAM789 is therefore inhibition of LOC202126 (Accession XM\_117362). Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 790 (VGAM790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30707] VGAM790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM790 was detected is described hereinabove with reference to Figs. 1–8.

[30708] VGAM790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30709] VGAM790 gene encodes a VGAM790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM790

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM790 precursor RNA is designated SEQ ID:776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:776 is located at position 5279 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30710] VGAM790 precursor RNA folds onto itself, forming VGAM790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30711] An enzyme complex designated DICER COMPLEX, `dices` the VGAM790 folded precursor RNA into VGAM790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 58%) nucleotide sequence of VGAM790 RNA is designated SEQ ID:3501, and is provided hereinbelow with reference to the sequence listing part.

[30712] VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM790 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[30713] VGAM790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM790 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30714] The complementary binding of VGAM790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM790 host target RNA into VGAM790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30715] It is appreciated that VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM790 host target genes. The mRNA of each one of this plurality of VGAM790 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM790 RNA, herein designated VGAM RNA, and which when bound by VGAM790 RNA causes inhibition of translation of respective one or more VGAM790 host target proteins.

[30716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM790 gene, herein designated VGAM GENE, on one or more VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30717] It is yet further appreciated that a function of VGAM790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM790 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM790 correlate with, and may be deduced from, the identity of the host target genes which VGAM790 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30718] Nucleotide sequences of the VGAM790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM790 are further described hereinbelow with reference to Table 1.

[30719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM790 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM790 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[30720] As mentioned hereinabove with reference to Fig. 1, a function of VGAM790 gene, herein designated VGAM is inhibition of expression of VGAM790 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM790 correlate with, and may be deduced from, the identity of the target genes which VGAM790 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30721] KIAA0635 (Accession NM\_014645) is a VGAM790 host target gene. KIAA0635 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:16056, to the nucleotide sequence of VGAM790 RNA, herein designated VGAM RNA, also designated SEQ ID:3501.

[30722] A function of VGAM790 is therefore inhibition of KIAA0635 (Accession NM\_014645). Accordingly, utilities of VGAM790 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0635. LOC150142 (Accession XM\_086791) is another VGAM790 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38850, to the nucleotide sequence of VGAM790 RNA, herein designated VGAM RNA, also designated SEQ ID:3501.

[30723] Another function of VGAM790 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM790 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC158187 (Accession XM\_098892) is another VGAM790 host target gene. LOC158187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158187 BINDING SITE, designated SEQ ID:41922, to

the nucleotide sequence of VGAM790 RNA, herein designated VGAM RNA, also designated SEQ ID:3501.

[30724] Another function of VGAM790 is therefore inhibition of LOC158187 (Accession XM\_098892). Accordingly, utilities of VGAM790 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158187. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 791 (VGAM791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30725] VGAM791 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM791 was detected is described hereinabove with reference to Figs. 1–8.

[30726] VGAM791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30727] VGAM791 gene encodes a VGAM791 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM791 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM791 precursor RNA is designated SEQ ID:777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:777 is located at position 6245 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30728] VGAM791 precursor RNA folds onto itself, forming VGAM791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM791 folded precursor RNA into VGAM791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM791 RNA is designated SEQ ID:3502, and is provided hereinbelow with reference to the sequence listing part.

[30730] VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM791 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[30731] VGAM791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM791 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30732] The complementary binding of VGAM791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM791 host target RNA into VGAM791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30733] It is appreciated that VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM791 host target genes. The mRNA of each one of this plurality of VGAM791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM791 RNA, herein designated VGAM RNA, and which when bound by VGAM791 RNA causes inhibition of translation of respective one or more VGAM791 host target proteins.

[30734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM791 gene, herein designated VGAM GENE, on one or more VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[30735] It is yet further appreciated that a function of VGAM791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM791 correlate with, and may be deduced from, the identity of the host target genes which VGAM791 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30736] Nucleotide sequences of the VGAM791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM791 are further described hereinbelow with reference to Table 1.

[30737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM791 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM791 gene, herein designated VGAM is inhibition of expression of VGAM791 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM791 correlate with, and may be deduced from, the identity of the target genes which VGAM791 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30739] S-adenosylhomocysteine Hydrolase (AHCY, Accession NM\_000687) is a VGAM791 host target gene. AHCY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHCY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHCY BINDING SITE, designated SEQ ID:6345, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30740] A function of VGAM791 is therefore inhibition of S-

adenosylhomocysteine Hydrolase (AHCY, Accession NM\_000687). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHCY. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093) is another VGAM791 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11554, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30741] Another function of VGAM791 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to

VGAM152. Cystathionine-β-synthase (CBS, Accession NM\_000071) is another VGAM791 host target gene. CBS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBS BINDING SITE, designated SEQ ID:5516, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30742] Another function of VGAM791 is therefore inhibition of Cystathionine-β-synthase (CBS, Accession NM\_000071). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBS. Ets Variant Gene 3 (ETV3, Accession NM\_005240) is another VGAM791 host target gene. ETV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ETV3 BINDING SITE, designated SEQ ID:11751, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30743] Another function of VGAM791 is therefore inhibition of Ets Variant Gene 3 (ETV3, Accession NM\_005240), a gene which Member of the ETS oncoprotein family. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETV3. The function of ETV3 has been established by previous studies. The ETS oncogene (OMIM Ref. No. 164720) was first described as part of a fusion gene transduced by the avian retrovirus E26. In E26, v-ets and v-myb (OMIM Ref. No. 189990) were fused to a portion of GAG to form the transforming gene. The ETS oncogene family shares a conserved peptide motif called the ETS domain that mediates sequence-specific DNA binding. This motif is unique among transcription factor families. Using partially degenerate oligonucleotides from conserved regions of the ETS domain and the polymerase chain reaction, Klemsz et al. (1994) isolated a new member of the ETS family, designated PE1, from HL60 cells. The PE1 gene was expressed as an approximately 5-kb

transcript in most cell lines tested. Klappacher et al. (2002) described a mechanism in which induction of the ETS repressor METS links terminal differentiation to cell cycle arrest. Using macrophages as a model, they provided evidence that METS blocks RAS (OMIM Ref. No. 190020)-dependent proliferation without inhibiting RAS-dependent expression of cell type-specific genes by selectively replacing ETS activators on the promoters of cell cycle control genes. The antiproliferative effects of METS required its interaction with DP103 (DDX20; 606168), a DEAD box-containing protein that assembles a novel corepressor complex. Functional interactions between the METS/DP103 complex and E2F (see OMIM Ref. No. 189971)/RB (see OMIM Ref. No. 180200) family proteins were also necessary for inhibition of cellular proliferation, suggesting a combinatorial code that directs permanent cell cycle exit during terminal differentiation. Using both in situ hybridization and study of human/hamster cell hybrids, Klemsz et al. (1994) demonstrated that the PE1 gene is located on 1q21-q23.

[30744] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30745] Klappacher, G. W.; Lunyak, V. V.; Sykes, D. B.; Sawka-Verhelle, D.; Sage, J.; Brard, G.; Ngo, S. D.; Gangadharan, D.; Jacks, T.; Kamps, M. P.; Rose, D. W.; Rosenfeld, M. G. : An induced Ets repressor complex regulates growth arrest during terminal macrophage differentiation. Cell 109: 169–180, 2002. ; and

[30746] Klemsz, M.; Hromas, R.; Raskind, W.; Bruno, E.; Hoffman, R. : PE-1, a novel ETS oncogene family member, localizes to chromosome 1q21–q23. Genomics 20: 291–294, 1994.

[30747] Further studies establishing the function and utilities of ETV3 are found in John Hopkins OMIM database record ID 164873, and in cited publications numbered 3141–3142 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Follistatin-like 1 (FSTL1, Accession NM\_007085) is another VGAM791 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13950, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ

ID:3502.

[30748] Another function of VGAM791 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM\_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 has been established by previous studies. Using degenerate primers designed against a peptide purified from a rat glioma cell line, Zwijsen et al. (1994) isolated a full-length follistatin-like cDNA (FSTL1), which they called FRP, from a human glioma cDNA library. FSTL1 encodes a deduced 308-amino acid protein with an N-terminal signal peptide of 20 amino acids. FSTL1 contains an FS module, a follistatin-like sequence containing 10 conserved cysteine residues. The number and distribution of the cysteine residues supports the existence of several intramolecular disulfide bridges. Zwijsen et al. (1994) did not detect any membrane-spanning or membrane-associated sequences in the FSTL1 sequence, but they predicted 3 putative N-glycosylation sites and several phosphorylation sites. Under denaturing conditions, Zwijsen et al. (1994) detected several isoforms of FSTL1 with

molecular masses of 40 to 48 kD which differs from the 50- to 55-kD products detected by Tanaka et al. (1998). Tanaka et al. (1998) hypothesized that the difference results from the molecular conditions affected by posttranslational modification. FSTL1 shares greater than 92% amino acid identity with the mouse homolog, known as Fstl or TSC-36, identified as a transforming growth factor-beta-inducible protein by Shibamura et al. (1993). Zwijsen et al. (1994) also noted sequence similarity to follistatin (OMIM Ref. No. 136470) and agrin (OMIM Ref. No. 103320), and could not detect any effect of FSTL1 on the cell growth inhibition of TGF-beta (OMIM Ref. No. 190180). Using Northern blot analysis, Tanaka et al. (1998) detected a broadly expressed 4.4-kb FSTL1 transcript most strongly in the heart, placenta, prostate, ovary, and small intestine. Expression was not detected in peripheral blood leukocytes. Tanaka et al. (1998) constructed synovium expression cDNA libraries made from rheumatoid arthritis (RA; 180300) patient-derived synovial cell mRNA. By screening the libraries by IgG purified from synovial fluids from RA patients, they identified FSTL1. Using immunoblotting analysis, they detected anti-FSTL1 antibodies as more frequent in the synovial fluids

and serum of RA patients than in patients with other systemic rheumatic diseases or in healthy individuals. patients. Immunoprecipitation analysis showed no difference between these groups in the amount of synovial FSTL1 protein, suggesting an elevated turnover in RA.

[30749] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30750] Tanaka, M.; Ozaki, S.; Osakada, F.; Mori, K.; Okubo, M.; Nakao, K. : Cloning of follistatin-related protein as a novel autoantigen in systemic rheumatic diseases. Int. Immun. 10: 1305-1314, 1998. ; and

[30751] Zwijsen, A.; Blockx, H.; van Arnhem, W.; Willems, J.; Fransen, L.; Devos, K.; Raymackers, J.; van de Voorde, A.; Slegers, H. : Characterization of a rat C6 glioma-secreted follistatin-r.

[30752] Further studies establishing the function and utilities of FSTL1 are found in John Hopkins OMIM database record ID 605547, and in cited publications numbered 6399-6401 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GA (Accession NM\_013267) is another VGAM791 host target gene. GA BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by GA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GA BINDING SITE, designated SEQ ID:14935, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30753] Another function of VGAM791 is therefore inhibition of GA (Accession NM\_013267). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GA. Maltase–glucoamylase (alpha–glucosidase) (MGAM, Accession XM\_051351) is another VGAM791 host target gene. MGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:35821, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30754] Another function of VGAM791 is therefore inhibition of Maltase–glucoamylase (alpha–glucosidase) (MGAM, Acces–

sion XM\_051351), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM. The function of MGAM has been established by previous studies. Maltase–glucoamylase (MGA; EC 3.2.1.20) is a brush border membrane enzyme that plays a role in the final steps of digestion of starch. Naim et al. (1988) showed that it is synthesized as a single–chain polypeptide precursor, acquires N– and O–linked carbohydrates, and does not undergo intracellular or extracellular proteolytic cleavage. Nichols et al. (1998) purified and partially sequenced the human maltase–glucoamylase protein. By RT–PCR using degenerate oligonucleotides based on the MGA protein sequence, they isolated human small intestine MGA cDNAs. The deduced 1,857–amino acid MGA protein has a putative type II membrane anchor, 2 WIDMNE catalytic sites, which are characteristic of carbohydrate hydrolases such as sucrase–isomaltase (SI; 222900), and 2 glycosyl hydrolase family 31 signature 2 sequences. MGA also has 19 potential N–glycosylation sites and 253 potential O–glycosylation sites. The MGA protein shares 59% sequence identity with SI. RT–PCR de–

tected MGA expression in human small intestine, granulocyte, and kidney but not in salivary gland or pancreas.

[30755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30756] Naim, H. Y.; Sterchi, E. E.; Lentze, M. J. : Structure, biosynthesis, and glycosylation of human small intestinal maltase–glucoamylase. *J. Biol. Chem.* 263: 19709–19717, 1988. ; and

[30757] Nichols, B. L.; Eldering, J.; Avery, S.; Hahn, D.; Quaroni, A.; Sterchi, E. : Human small intestinal maltase–glucoamylase cDNA cloning: homology to sucrase–isomaltase. *J. Biol. Chem.* 273: 3.

[30758] Further studies establishing the function and utilities of MGAM are found in John Hopkins OMIM database record ID 154360, and in cited publications numbered 12706–12708 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SH3–domain GRB2–like 1 (SH3GL1, Accession NM\_003025) is another VGAM791 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8960, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30759] Another function of VGAM791 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession NM\_003025). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385) is another VGAM791 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17691, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30760] Another function of VGAM791 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession

NM\_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Tropomodulin 2 (neuronal) (TMOD2, Accession NM\_014548) is another VGAM791 host target gene. TMOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD2 BINDING SITE, designated SEQ ID:15862, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30761] Another function of VGAM791 is therefore inhibition of Tropomodulin 2 (neuronal) (TMOD2, Accession NM\_014548), a gene which is an actin-capping protein for the slow-growing end of filamentous actin. Accordingly, utilities of VGAM791 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TMOD2. The function of TMOD2 has been established by previous studies. Watakabe et al. (1996) identified and purified rat NTMOD as a protein that binds to the neuron-specific tropomyosin isoform, Tmbr3. Using degenerate oligonucleotides based on peptide sequences of NTMOD, they cloned an NTMOD cDNA from a rat brain cDNA library. Northern blot and RNase protection analyses detected NTMOD mRNA expression predominantly in brain. Immunofluorescence of primary frontal cortex cell cultures showed that NTMOD is specifically expressed in neurons. By screening a human cerebellar cDNA library with a portion of the rat NTMOD as probe, Cox and Zoghbi (2000) cloned a human NTMOD cDNA, designated TMOD2. TMOD2 encodes a deduced 351-amino acid protein. Northern blot analysis demonstrated restricted expression of TMOD2 in neuronal tissues; an approximately 9.5-kb transcript was seen in all brain regions. Cox and Zoghbi (2000) also cloned the mouse ortholog. Northern blot analysis showed that expression of mouse Tmod2 occurred as early as embryonic day 7 and progressively increased during development.

[30762] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [30763] Watakabe, A.; Kobayashi, R.; Helfman, D. M. : N-tropomodulin: a novel isoform of tropomodulin identified as the major binding protein to brain tropomyosin. J. Cell Sci. 109: 2299–2310, 1996. ; and
- [30764] Cox, P. R.; Zoghbi, H. Y. : Sequencing, expression analysis, and mapping of three unique human tropomodulin genes and their mouse orthologs. Genomics 63: 97–107, 2000.
- [30765] Further studies establishing the function and utilities of TMOD2 are found in John Hopkins OMIM database record ID 602928, and in cited publications numbered 7751–7752 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM\_001243) is another VGAM791 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE,

designated SEQ ID:6912, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30766] Another function of VGAM791 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM\_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8. The function of TNFRSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154.ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672) is another VGAM791 host target gene. ABCA5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA5 BINDING SITE, designated SEQ ID:20747, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ

ID:3502.

[30767] Another function of VGAM791 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA5. Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM\_013434) is another VGAM791 host target gene. CSEN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSEN BINDING SITE, designated SEQ ID:15088, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30768] Another function of VGAM791 is therefore inhibition of Calsenilin, Presenilin Binding Protein, EF Hand Transcription Factor (CSEN, Accession NM\_013434). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSEN. DKFZP667O116 (Accession XM\_168586) is an-

other VGAM791 host target gene. DKFZP667O116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP667O116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP667O116 BINDING SITE, designated SEQ ID:45264, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30769] Another function of VGAM791 is therefore inhibition of DKFZP667O116 (Accession XM\_168586). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP667O116. FLJ14326 (Accession NM\_032191) is another VGAM791 host target gene. FLJ14326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14326 BINDING SITE, designated SEQ ID:25905, to the nucleotide sequence of VGAM791 RNA, herein designated

VGAM RNA, also designated SEQ ID:3502.

[30770] Another function of VGAM791 is therefore inhibition of FLJ14326 (Accession NM\_032191). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326. FLJ20359 (Accession NM\_017781) is another VGAM791 host target gene. FLJ20359 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20359 BINDING SITE, designated SEQ ID:19412, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30771] Another function of VGAM791 is therefore inhibition of FLJ20359 (Accession NM\_017781). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20359. FLJ22471 (Accession NM\_025140) is another VGAM791 host target gene. FLJ22471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22471, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22471 BINDING SITE, designated SEQ ID:24778, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30772] Another function of VGAM791 is therefore inhibition of FLJ22471 (Accession NM\_025140). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22471. KIAA0543 (Accession XM\_044213) is another VGAM791 host target gene. KIAA0543 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0543 BINDING SITE, designated SEQ ID:34178, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30773] Another function of VGAM791 is therefore inhibition of KIAA0543 (Accession XM\_044213). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0543. KIAA0775 (Accession NM\_014726) is another VGAM791 host target gene. KIAA0775 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:16320, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30774] Another function of VGAM791 is therefore inhibition of KIAA0775 (Accession NM\_014726). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775. KIAA0939 (Accession XM\_030524) is another VGAM791 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31067, to the

nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30775] Another function of VGAM791 is therefore inhibition of KIAA0939 (Accession XM\_030524). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1054 (Accession XM\_043493) is another VGAM791 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33958, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30776] Another function of VGAM791 is therefore inhibition of KIAA1054 (Accession XM\_043493). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1155 (Accession XM\_030864) is another VGAM791 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31202, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30777] Another function of VGAM791 is therefore inhibition of KIAA1155 (Accession XM\_030864). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. Protocadherin 19 (PCDH19, Accession XM\_033173) is another VGAM791 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31862, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30778] Another function of VGAM791 is therefore inhibition of

Protocadherin 19 (PCDH19, Accession XM\_033173). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. Prefoldin 1 (PFDN1, Accession NM\_002622) is another VGAM791 host target gene. PFDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFDN1 BINDING SITE, designated SEQ ID:8484, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30779] Another function of VGAM791 is therefore inhibition of Prefoldin 1 (PFDN1, Accession NM\_002622). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN1. Retinoic Acid Induced 16 (RAI16, Accession NM\_022749) is another VGAM791 host target gene. RAI16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI16, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI16 BINDING SITE, designated SEQ ID:22971, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30780] Another function of VGAM791 is therefore inhibition of Retinoic Acid Induced 16 (RAI16, Accession NM\_022749). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI16. LOC115509 (Accession XM\_056092) is another VGAM791 host target gene. LOC115509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115509 BINDING SITE, designated SEQ ID:36365, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30781] Another function of VGAM791 is therefore inhibition of LOC115509 (Accession XM\_056092). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC115509. LOC127281 (Accession XM\_059128) is another VGAM791 host target gene. LOC127281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127281 BINDING SITE, designated SEQ ID:36892, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30782] Another function of VGAM791 is therefore inhibition of LOC127281 (Accession XM\_059128). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127281. LOC130813 (Accession XM\_065904) is another VGAM791 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37314, to

the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30783] Another function of VGAM791 is therefore inhibition of LOC130813 (Accession XM\_065904). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC145468 (Accession XM\_057874) is another VGAM791 host target gene. LOC145468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145468 BINDING SITE, designated SEQ ID:36550, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30784] Another function of VGAM791 is therefore inhibition of LOC145468 (Accession XM\_057874). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145468. LOC150155 (Accession XM\_047977) is another VGAM791 host target gene. LOC150155 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150155 BINDING SITE, designated SEQ ID:35092, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30785] Another function of VGAM791 is therefore inhibition of LOC150155 (Accession XM\_047977). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150155. LOC200982 (Accession XM\_117305) is another VGAM791 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43378, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30786] Another function of VGAM791 is therefore inhibition of LOC200982 (Accession XM\_117305). Accordingly, utilities

of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC204301 (Accession XM\_115306) is another VGAM791 host target gene. LOC204301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC204301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204301 BINDING SITE, designated SEQ ID:43096, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30787] Another function of VGAM791 is therefore inhibition of LOC204301 (Accession XM\_115306). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204301. LOC221968 (Accession XM\_166524) is another VGAM791 host target gene. LOC221968 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221968, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221968 BINDING SITE, designated SEQ ID:44470, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30788] Another function of VGAM791 is therefore inhibition of LOC221968 (Accession XM\_166524). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221968. LOC253128 (Accession XM\_170726) is another VGAM791 host target gene. LOC253128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253128 BINDING SITE, designated SEQ ID:45485, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30789] Another function of VGAM791 is therefore inhibition of LOC253128 (Accession XM\_170726). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253128. LOC254358 (Accession XM\_170771) is another VGAM791 host target gene. LOC254358 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254358 BINDING SITE, designated SEQ ID:45534, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30790] Another function of VGAM791 is therefore inhibition of LOC254358 (Accession XM\_170771). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254358. LOC254413 (Accession XM\_173141) is another VGAM791 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46404, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30791] Another function of VGAM791 is therefore inhibition of

LOC254413 (Accession XM\_173141). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC254428 (Accession XM\_170932) is another VGAM791 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45717, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30792] Another function of VGAM791 is therefore inhibition of LOC254428 (Accession XM\_170932). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC254659 (Accession XM\_170822) is another VGAM791 host target gene. LOC254659 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254659 BINDING SITE, designated SEQ ID:45601, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30793] Another function of VGAM791 is therefore inhibition of LOC254659 (Accession XM\_170822). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254659. LOC254755 (Accession XM\_173224) is another VGAM791 host target gene. LOC254755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254755 BINDING SITE, designated SEQ ID:46489, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30794] Another function of VGAM791 is therefore inhibition of LOC254755 (Accession XM\_173224). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254755. LOC254848 (Accession XM\_173133) is an-

other VGAM791 host target gene. LOC254848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:46379, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30795] Another function of VGAM791 is therefore inhibition of LOC254848 (Accession XM\_173133). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848. LOC51107 (Accession NM\_016022) is another VGAM791 host target gene. LOC51107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51107 BINDING SITE, designated SEQ ID:18098, to the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, also designated SEQ ID:3502.

[30796] Another function of VGAM791 is therefore inhibition of LOC51107 (Accession NM\_016022). Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51107. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 792 (VGAM792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30797] VGAM792 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM792 was detected is described hereinabove with reference to Figs. 1–8.

[30798] VGAM792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30799] VGAM792 gene encodes a VGAM792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM792

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM792 precursor RNA is designated SEQ ID:778, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:778 is located at position 13192 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30800] VGAM792 precursor RNA folds onto itself, forming VGAM792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30801] An enzyme complex designated DICER COMPLEX, `dices` the VGAM792 folded precursor RNA into VGAM792 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM792 RNA is designated SEQ ID:3503, and is provided hereinbelow with reference to the sequence listing part.

[30802] VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM792 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[30803] VGAM792 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM792 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30804] The complementary binding of VGAM792 RNA, herein designated VGAM RNA, to host target binding sites on VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM792 host target RNA into VGAM792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30805] It is appreciated that VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM792 host target genes. The mRNA of

each one of this plurality of VGAM792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM792 RNA, herein designated VGAM RNA, and which when bound by VGAM792 RNA causes inhibition of translation of respective one or more VGAM792 host target proteins.

[30806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM792 gene, herein designated VGAM GENE, on one or more VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[30807] It is yet further appreciated that a function of VGAM792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM792 correlate with, and may be deduced from, the identity of the host target genes which VGAM792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30808] Nucleotide sequences of the VGAM792 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM792 are further described hereinbelow with reference to Table 1.

[30809] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM792 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30810] As mentioned hereinabove with reference to Fig. 1, a function of VGAM792 gene, herein designated VGAM is inhibition of expression of VGAM792 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM792 correlate with, and may be deduced from, the identity of the target genes which VGAM792 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30811] EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM\_004105) is a VGAM792 host target gene. EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EFEMP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2, designated SEQ ID:10317 and SEQ ID:20837 respectively, to the nucleotide sequence of VGAM792 RNA, herein designated VGAM RNA, also designated SEQ ID:3503.

[30812] A function of VGAM792 is therefore inhibition of EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM\_004105). Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFEMP1. Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043) is another VGAM792 host target gene. SLC6A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A6 BINDING SITE, designated SEQ ID:9005, to the nucleotide sequence of VGAM792 RNA, herein designated VGAM RNA, also designated SEQ ID:3503.

[30813] Another function of VGAM792 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043), a gene which transports taurine and other beta-amino acids like beta-alanine. Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A6. The function of

SLC6A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. ARHGAP10 (Accession NM\_020824) is another VGAM792 host target gene. ARHGAP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP10 BINDING SITE, designated SEQ ID:21887, to the nucleotide sequence of VGAM792 RNA, herein designated VGAM RNA, also designated SEQ ID:3503.

[30814] Another function of VGAM792 is therefore inhibition of ARHGAP10 (Accession NM\_020824). Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP10. FLJ21126 (Accession XM\_117367) is another VGAM792 host target gene. FLJ21126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ21126 BINDING SITE, designated SEQ ID:43417, to the nucleotide sequence of VGAM792 RNA, herein designated VGAM RNA, also designated SEQ ID:3503.

[30815] Another function of VGAM792 is therefore inhibition of FLJ21126 (Accession XM\_117367). Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 793 (VGAM793) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30816] VGAM793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM793 was detected is described hereinabove with reference to Figs. 1–8.

[30817] VGAM793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30818] VGAM793 gene encodes a VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM793 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM793 precursor RNA is designated SEQ ID:779, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:779 is located at position 10748 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30819] VGAM793 precursor RNA folds onto itself, forming VGAM793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30820] An enzyme complex designated DICER COMPLEX, `dices` the VGAM793 folded precursor RNA into VGAM793 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM793 RNA is designated SEQ ID:3504, and is provided hereinbelow with reference to the sequence listing part.

[30821] VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM793 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30822] VGAM793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM793 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30823] The complementary binding of VGAM793 RNA, herein designated VGAM RNA, to host target binding sites on VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM793 host target RNA into VGAM793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30824] It is appreciated that VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM793 host target genes. The mRNA of each one of this plurality of VGAM793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM793 RNA, herein designated VGAM RNA, and which when bound by VGAM793 RNA causes inhibition of translation of respective one or more VGAM793 host target proteins.

[30825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM793 gene, herein designated VGAM GENE, on one or more VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30826] It is yet further appreciated that a function of VGAM793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM793 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM793 correlate with, and may be deduced from, the identity of the host target genes which VGAM793 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30827] Nucleotide sequences of the VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM793 are further described hereinbelow with reference to Table 1.

[30828] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM793 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30829] As mentioned hereinabove with reference to Fig. 1, a function of VGAM793 gene, herein designated VGAM is inhibition of expression of VGAM793 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM793 correlate with, and may be deduced from, the identity of the target genes which VGAM793 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30830] Myosin, Light Polypeptide Kinase (MYLK, Accession XM\_173098) is a VGAM793 host target gene. MYLK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYLK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLK BINDING SITE, designated SEQ ID:46357, to the nucleotide sequence of VGAM793 RNA, herein designated VGAM

RNA, also designated SEQ ID:3504.

[30831] A function of VGAM793 is therefore inhibition of Myosin, Light Polypeptide Kinase (MYLK, Accession XM\_173098), a gene which is involved in contraction of smooth muscle. Accordingly, utilities of VGAM793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK. The function of MYLK has been established by previous studies. The contraction of smooth muscle begins with the phosphorylation of the light chain of myosin (e.g., 160781), a reaction catalyzed by myosin light chain kinase that is itself activated by the binding of calcium-calmodulin (see OMIM Ref. No. 114180). This key enzyme in muscle contraction, which exists in both non-muscle and smooth muscle isoforms, has been shown by immunohistology to be present in neurons and glia.

[30832] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30833] Potier, M.-C.; Chelot, E.; Pekarsky, Y.; Gardiner, K.; Rossier, J.; Turnell, W. G. : The human myosin light chain kinase (MLCK) from hippocampus: cloning, sequencing, expression, and localization to 3cen-q21. Genomics 29: 562-570, 1995. ; and

[30834] Watterson, D. M.; Schavocky, J. P.; Guo, L.; Weiss, C.; Chlenski, A.; Shirinsky, V. P.; Van Eldik, L. J.; Haiech, J. : Analysis of the kinase-related protein gene found at human chromo.

[30835] Further studies establishing the function and utilities of MYLK are found in John Hopkins OMIM database record ID 600922, and in cited publications numbered 9958–9963 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEPC-1 (Accession NM\_139178) is another VGAM793 host target gene. DEPC-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DEPC-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEPC-1 BINDING SITE, designated SEQ ID:29192, to the nucleotide sequence of VGAM793 RNA, herein designated VGAM RNA, also designated SEQ ID:3504.

[30836] Another function of VGAM793 is therefore inhibition of DEPC-1 (Accession NM\_139178). Accordingly, utilities of VGAM793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEPC-1.

LOC154007 (Accession XM\_087824) is another VGAM793 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39450, to the nucleotide sequence of VGAM793 RNA, herein designated VGAM RNA, also designated SEQ ID:3504.

[30837] Another function of VGAM793 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 794 (VGAM794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30838] VGAM794 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM794 was detected is described hereinabove with reference to Figs. 1–8.

[30839] VGAM794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30840] VGAM794 gene encodes a VGAM794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM794 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM794 precursor RNA is designated SEQ ID:780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:780 is located at position 80483 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30841] VGAM794 precursor RNA folds onto itself, forming VGAM794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30842] An enzyme complex designated DICER COMPLEX, `dices` the VGAM794 folded precursor RNA into VGAM794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM794 RNA is designated SEQ ID:3505, and is provided hereinbelow with reference to the sequence listing part.

[30843] VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM794 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30844] VGAM794 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM794 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30845] The complementary binding of VGAM794 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM794 host target RNA into VGAM794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30846] It is appreciated that VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM794 host target genes. The mRNA of each one of this plurality of VGAM794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM794 RNA, herein designated VGAM RNA, and which when bound by VGAM794 RNA causes inhibition of translation of respective one or more VGAM794 host target proteins.

[30847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM794 gene, herein designated VGAM GENE, on one or more VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30848] It is yet further appreciated that a function of VGAM794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM794 correlate with, and may be deduced from, the identity of the host target genes which VGAM794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30849] Nucleotide sequences of the VGAM794 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM794 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM794 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM794 are further  
described hereinbelow with reference to Table 1.

[30850] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM794 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM794 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[30851] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM794 gene, herein designated VGAM is  
inhibition of expression of VGAM794 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM794 correlate with, and may be deduced  
from, the identity of the target genes which VGAM794  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[30852] Platelet-derived Growth Factor Receptor, Alpha Polypep-  
tide (PDGFRA, Accession NM\_006206) is a VGAM794 host

target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12879, to the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30853] A function of VGAM794 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM\_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. KIAA0222 (Accession NM\_014643) is another VGAM794 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0222, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16047, to the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30854] Another function of VGAM794 is therefore inhibition of KIAA0222 (Accession NM\_014643). Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. PRO1600 (Accession NM\_014095) is another VGAM794 host target gene. PRO1600 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1600 BINDING SITE, designated SEQ ID:15315, to the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30855] Another function of VGAM794 is therefore inhibition of PRO1600 (Accession NM\_014095). Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO1600. TEB4 (Accession XM\_027156) is another VGAM794 host target gene. TEB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEB4 BINDING SITE, designated SEQ ID:30429, to the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30856] Another function of VGAM794 is therefore inhibition of TEB4 (Accession XM\_027156). Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEB4. LOC125268 (Accession XM\_071960) is another VGAM794 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:37452, to the nucleotide se-

quence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30857] Another function of VGAM794 is therefore inhibition of LOC125268 (Accession XM\_071960). Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268. LOC220469 (Accession XM\_084334) is another VGAM794 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:37556, to the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, also designated SEQ ID:3505.

[30858] Another function of VGAM794 is therefore inhibition of LOC220469 (Accession XM\_084334). Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 795 (VGAM795) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30859] VGAM795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM795 was detected is described hereinabove with reference to Figs. 1–8.

[30860] VGAM795 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30861] VGAM795 gene encodes a VGAM795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM795 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM795 precursor RNA is designated SEQ ID:781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:781 is located at position 88141 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform

virus).

[30862] VGAM795 precursor RNA folds onto itself, forming VGAM795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30863] An enzyme complex designated DICER COMPLEX, `dices` the VGAM795 folded precursor RNA into VGAM795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM795 RNA is designated SEQ ID:3506, and is provided hereinbelow with reference to the sequence listing part.

[30864] VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM795 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30865] VGAM795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM795 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM795 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30866] The complementary binding of VGAM795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM795 host target RNA into VGAM795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30867] It is appreciated that VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM795 host target genes. The mRNA of each one of this plurality of VGAM795 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM795 RNA, herein designated VGAM RNA, and which when bound by VGAM795 RNA causes inhibition of translation of respective one or more VGAM795 host target proteins.

[30868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM795 gene, herein designated VGAM GENE, on one or more VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30869] It is yet further appreciated that a function of VGAM795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific func-

tions, and accordingly utilities, of VGAM795 correlate with, and may be deduced from, the identity of the host target genes which VGAM795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30870] Nucleotide sequences of the VGAM795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM795 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM795 are further described hereinbelow with reference to Table 1.

[30871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM795 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30872] As mentioned hereinabove with reference to Fig. 1, a function of VGAM795 gene, herein designated VGAM is inhibition of expression of VGAM795 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM795 correlate with, and may be deduced from, the identity of the target genes which VGAM795 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30873] Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160) is a VGAM795 host target gene. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:6832 and SEQ ID:14871 respectively, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30874] A function of VGAM795 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of

APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.DEK Oncogene (DNA binding) (DEK, Accession NM\_003472) is another VGAM795 host target gene. DEK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEK BINDING SITE, designated SEQ ID:9538, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30875] Another function of VGAM795 is therefore inhibition of DEK Oncogene (DNA binding) (DEK, Accession NM\_003472), a gene which interacts in transcriptional regulation and signal transduction. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEK. The function of DEK has been established by previous studies. By agarose gel electrophoresis analysis of HeLa nuclear extracts, Alexiadis et al. (2000) detected DEK-induced alterations of the superhelical density of DNA in

chromatin in the presence of topoisomerase I (TOP1; 126420) or II (TOP2A; 126430). The change in topology was not observed in naked DNA. SDS-PAGE analysis indicated that DEK does not induce displacement of histones but that histone H2A/H2B (see OMIM Ref. No. 142711) is required for the DEK-mediated change in nucleosomal DNA topology. Agarose gel electrophoresis analysis showed that DEK reduces the efficiency with which chromatin is replicated. Pre-mRNA splicing involves the step-wise assembly of large RNA-protein complexes, termed spliceosomes, that contain small nuclear ribonucleoprotein particles (OMIM Ref. No. snRNPs) and many non-snRNP splicing factors, many of which contain RS domains (i.e., alternating arg/ser residues). Members of the SR protein family have N-terminal RNA recognition motifs and a phosphorylated C-terminal RS domain. Using splicing and immunoprecipitation assays, McGarvey et al. (2000) identified DEK as one of the first components of the splicing complex that remains associated with spliced exons dependent on prior splicing of pre-mRNA. The association is mediated by specific interactions involving SR proteins such as SRM160 (OMIM Ref. No. 605975).

[30876] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [30877] Alexiadis, V.; Waldmann, T.; Andersen, J.; Mann, M.; Knippers, R.; Gruss, C. : The protein encoded by the proto-oncogene DEK changes the topology of chromatin and reduces the efficiency of DNA replication in a chromatin-specific manner. *Genes Dev.* 14: 1308–1312, 2000. ; and
- [30878] McGarvey, T.; Rosonina, E.; McCracken, S.; Li, Q.; Arnaout, R.; Mientjes, E.; Nickerson, J. A.; Awrey, D.; Greenblatt, J.; Grosveld, G.; Blencowe, B. J. : The acute myeloid leukemia-a.
- [30879] Further studies establishing the function and utilities of DEK are found in John Hopkins OMIM database record ID 125264, and in cited publications numbered 2005–2009 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051) is another VGAM795 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE,

designated SEQ ID:22587, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30880] Another function of VGAM795 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Early Growth Response 3 (EGR3, Accession XM\_005040) is another VGAM795 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29958, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30881] Another function of VGAM795 is therefore inhibition of

Early Growth Response 3 (EGR3, Accession XM\_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. Gamma-aminobutyric Acid (GABA) A Receptor, Pi (GABRP, Accession NM\_014211) is another VGAM795 host target gene. GABRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRP BINDING SITE, designated SEQ ID:15480, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30882] Another function of VGAM795 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Pi (GABRP, Accession NM\_014211), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly,

utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRP. The function of GABRP has been established by previous studies. GABA is the major inhibitory neurotransmitter in the mammalian central nervous system and acts by binding to GABA-A receptors (see OMIM Ref. No. 137192). By searching a human EST database with a GABA-A receptor consensus sequence, Hedblom and Kirkness (1997) identified a cDNA encoding GABRP. Sequence analysis revealed that GABRP represented a novel class of GABA-A receptor subunits, being 30 to 40% identical to the 5 subunit classes previously identified. Northern blot analysis showed that the 3.3-kb GABRP mRNA was expressed in several tissues, with particular abundance in the uterus. Hedblom and Kirkness (1997) also cloned cDNAs encoding the rat GABRP homolog. The predicted 440-amino acid sequence of human GABRP is 93% identical to that of rat Gabrp. Expression of human GABRP in mammalian cells indicated that GABRP can combine with other GABA-A receptor subunits and alter the sensitivity of recombinant receptors to modulatory agents such as the steroid pregnanolone. In a review of GABA-A receptors, Whiting et al. (1999) stated that the GABRP gene

maps to 5q32–q33.

[30883] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30884] Hedblom, E.; Kirkness, E. F. : A novel class of GABA–A receptor subunit in tissues of the reproductive system. J. Biol. Chem. 272: 15346–15350, 1997. ; and

[30885] Whiting, P. J.; Bonnert, T. P.; McKernan, R. M.; Farrar, S.; le Bourdelles, B.; Heavens, R. P.; Smith, D. W.; Hewson, L.; Rigby, M. R.; Sirinathsinghji, D. J. S.; Thompson, S. A.; Waffo.

[30886] Further studies establishing the function and utilities of GABRP are found in John Hopkins OMIM database record ID 602729, and in cited publications numbered 8591 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MTERF (Accession NM\_006980) is another VGAM795 host target gene. MTERF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTERF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTERF BINDING SITE, designated SEQ

ID:13842, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30887] Another function of VGAM795 is therefore inhibition of MTERF (Accession NM\_006980), a gene which plays a central role in attenuating transcription between the 16S ribosomal RNA and the tRNA-leu genes in the heavy strand of mitochondrial DNA. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTERF. The function of MTERF has been established by previous studies. The mitochondrial transcription termination factor, or MTERF, plays a central role in attenuating transcription between the 16S ribosomal RNA (OMIM Ref. No. 561010) and the tRNA-leu (OMIM Ref. No. 590050) genes in the heavy strand of mitochondrial DNA, and therefore is part of the regulatory system that allows high levels of ribosomal RNA expression relative to downstream genes. From HeLa cells, Daga et al. (1993) purified 2 related 34-kD polypeptides that had MTERF activity. Fernandez-Silva et al. (1997) cloned the MTERF cDNA by RT-PCR of HeLa cell mRNA using primers derived from peptide sequences of the purified protein. The cDNA encoded a predicted

399-amino acid protein containing a mitochondrial targeting sequence. The mature MTERF protein is 342 amino acids long and contains 3 leucine zipper and 2 basic domains. Mutational analysis showed that all of these domains are necessary for DNA binding, and that the 2 basic domains are involved in directly binding MTERF to its target DNA sequence. Fernandez-Silva et al. (1997) showed that MTERF binds to DNA as a monomer.

[30888] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30889] Daga, A.; Micol, V.; Hess, D.; Aebersold, R.; Attardi, G. : Molecular characterization of the transcription termination factor from human mitochondria. J. Biol. Chem. 268: 8123-8130, 1993. ; and

[30890] Fernandez-Silva, P.; Martinez-Azorin, F.; Micol, V.; Attardi, G. : The human mitochondrial transcription termination factor (mTERF) is a multizipper protein but binds to DNA as a monomer.

[30891] Further studies establishing the function and utilities of MTERF are found in John Hopkins OMIM database record ID 602318, and in cited publications numbered 6299-6301 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM\_002731) is another VGAM795 host target gene. PRKACB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKACB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACB BINDING SITE, designated SEQ ID:8604, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30892] Another function of VGAM795 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM\_002731), a gene which is the catalytic beta subunit of cAMP-dependent protein kinase (PKA). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACB. The function of PRKACB has been established by previous studies. Most of the effects of cAMP in the eukaryotic cell are mediated through the phosphorylation of target proteins on serine or threonine residues by the cAMP-dependent protein kinase (EC 2.7.1.37). The

inactive cAMP-dependent protein kinase is a tetramer composed of 2 regulatory and 2 catalytic subunits. The cooperative binding of 4 molecules of cAMP dissociates the enzyme in a regulatory subunit dimer and 2 free active catalytic subunits. In the human, 4 different regulatory subunits (PRKAR1A, 188830; PRKAR1B, 176911; PRKAR2A, 176910; and PRKAR2B, 176912) and 3 catalytic subunits (PRKACA; PRKACB, 176892; and PRKACG 176893) have been identified. Animal model experiments lend further support to the function of PRKACB. The intracellular second messenger cAMP affects cell physiology by directly interacting with effector molecules that include cyclic nucleotide-gated ion channels, cAMP-regulated G protein exchange factors, and cAMP-dependent protein kinases (PKA). Two catalytic subunits, C-alpha (OMIM Ref. No. PRKACA) and C-beta (OMIM Ref. No. PRKACB), are expressed in the mouse and mediate the effects of PKA. Skalhogg et al. (2002) generated a null mutation in the major catalytic subunit of PKA, C-alpha, and observed early postnatal lethality in the majority of C-alpha knockout mice. Surprisingly, a small percentage of C-alpha knockout mice, although runted, survived to adulthood. This growth retardation was not due to decreased GH

(OMIM Ref. No. 139250) production but did correlate with a reduction in IGF1 (OMIM Ref. No. 147440) mRNA in the liver and diminished production of the major urinary proteins in kidney. In these animals, compensatory increases in C-beta levels occurred in brain whereas many tissues, including skeletal muscle, heart, and sperm, contained less than 10% of the normal PKA activity. Analysis of sperm in C-alpha knockout males revealed that spermatogenesis progressed normally but that mature sperm had defective forward motility

[30893] It is appreciated that the abovementioned animal model for PRKACB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[30894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30895] Skalhegg, B. S.; Huang, Y.; Su, T.; Idzerda, R. L.; McKnight, G. S.; Burton, K. A. : Mutation of the C-alpha subunit of PKA leads to growth retardation and sperm dysfunction. Molec. Endocr. 16: 630-639, 2002. ; and

[30896] Tasken, K.; Solberg, R.; Zhao, Y.; Hansson, V.; Jahnsen, T.; Siciliano, M. J. : The gene encoding the catalytic subunit

C-alpha of cAMP-dependent protein kinase (locus PRKACA) localize.

[30897] Further studies establishing the function and utilities of PRKACB are found in John Hopkins OMIM database record ID 176892, and in cited publications numbered 11263 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, Lysine Deficient 3 (PRKWINK3, Accession XM\_029183) is another VGAM795 host target gene. PRKWINK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKWINK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWINK3 BINDING SITE, designated SEQ ID:30856, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30898] Another function of VGAM795 is therefore inhibition of Protein Kinase, Lysine Deficient 3 (PRKWINK3, Accession XM\_029183). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWINK3. RAB30, Member RAS Oncogene Family (RAB30, Accession NM\_014488) is

another VGAM795 host target gene. RAB30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB30 BINDING SITE, designated SEQ ID:15833, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30899] Another function of VGAM795 is therefore inhibition of RAB30, Member RAS Oncogene Family (RAB30, Accession NM\_014488), a gene which is a GTP-binding protein. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB30. The function of RAB30 has been established by previous studies. Chen et al. (1996) isolated a cDNA encoding RAB30, a small GTP-binding protein of the RAB family, from a human melanocyte cDNA library and from melanoma cells. The deduced 203-amino acid RAB30 protein shares minimal homology with previously documented GTPases. Northern blot analysis detected RAB30 transcripts ranging from 1.7 to 11 kb in most tissues tested. By somatic cell hybrid analysis, Chen et al.

(1996) mapped the RAB30 gene to chromosome 11. Scott (2001) localized the RAB30 gene to 11q12–q14 based on sequence similarity between the RAB30 sequence (GenBank U57092) and chromosome 11 clones (GenBank AP000893 and AP000905).

[30900] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30901] Chen, D.; Guo, J.; Miki, T.; Tachibana, M.; Gahl, W. A. : Molecular cloning of two novel rab genes from human melanocytes. Gene 174: 129–134, 1996. ; and

[30902] Scott, A. F. : Personal Communication. Baltimore, Md., 2/26/2001.

[30903] Further studies establishing the function and utilities of RAB30 are found in John Hopkins OMIM database record ID 605693, and in cited publications numbered 6469 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM\_165641) is another VGAM795 host target gene. RB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1 BINDING SITE, designated SEQ ID:43706, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30904] Another function of VGAM795 is therefore inhibition of Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM\_165641), a gene which probably acts as a regulator of other genes. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1. The function of RB1 has been established by previous studies. Retinoblastoma (RB) is an embryonic neoplasm of retinal origin. It almost always presents in early childhood and is often bilateral. Spontaneous regression (OMIM Ref. No. 'cure') occurs in some cases. Connolly et al. (1983) reported a 4-generation family with 3 patterns of expression of the retinoblastoma gene: frank retinoblastoma, unilateral or bilateral; retinoma; and no visible retinal pathology except for 'normal degeneration' with age. ('Paving stone degeneration' of the type observed in 2 of 3 RB carriers, aged 49 and 59, is said by Duane (1980) to occur in about 20% of the adult population.) Gallie and Phillips (1982) described

benign lesions in the retina in retinoblastoma patients. The distinctive characteristics of these lesions, referred to by the authors as retinomas, included a translucent, grayish retinal mass protruding into the vitreous, 'cottage-cheese' calcification in 75%, and retinal pigment epithelial migration and proliferation in 60%. They suggested that retinomas represent not the heterozygous state postulated by the Knudson 2-stage model of carcinogenesis but rather the homozygous state occurring in differentiated cell(s). Gallie et al. (1982) suggested that retinomas represent either spontaneous regression of a retinoblastoma or a benign manifestation of the RB gene. Animal model experiments lend further support to the function of RB1. Windle et al. (1990) created transgenic mice by microinjecting fertilized ova with a chimeric gene containing the protein coding region of the SV40 T antigen (Tag) driven by the promoter of the luteinizing hormone beta-subunit gene. One of the male founders developed bilateral retinoblastomas at about age 5 months. The phenotype was heritable with complete penetrance in transgenic offspring in whom the tumors were first observed at about 2 months. Windle et al. (1990) demonstrated specific association between p105(Rb) and T antigen in mouse

retinoblastoma tumor cells. Thus, evidence is provided for oncogenesis due to the ocular-specific expression of an Rb-binding oncoprotein that can functionally inactivate the Rb protein.

[30905] It is appreciated that the abovementioned animal model for RB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[30906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30907] Connolly, M. J.; Payne, R. H.; Johnson, G.; Gallie, B. L.; Alderdice, P. W.; Marshall, W. H.; Lawton, R. D. : Familial, EsD-linked, retinoblastoma with reduced penetrance and variable expressivity. Hum. Genet. 65: 122-124, 1983. ; and

[30908] Gallie, B. L.; Ellsworth, R. M.; Abramson, D. M.; Phillips, R. A. : Retinoma: spontaneous regression of retinoblastoma or benign manifestation of the mutation? Brit. J. Cancer 45: 513-5.

[30909] Further studies establishing the function and utilities of RB1 are found in John Hopkins OMIM database record ID 180200, and in cited publications numbered

11148–11159, 10077–10078, 43, 82–87, 2358–2378, 4980–2384, 705–711, 4714–715, 3239–730, 5644–5656, 16 and 5657–5664 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM\_003243) is another VGAM795 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9252, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30910] Another function of VGAM795 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM\_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB3. The function of TGFB3 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139.APCL (Accession NM\_005883) is another VGAM795 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12499, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30911] Another function of VGAM795 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803) is another VGAM795 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CECR7 BINDING SITE, designated SEQ ID:38882, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30912] Another function of VGAM795 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. FHX (Accession NM\_018416) is another VGAM795 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20459, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30913] Another function of VGAM795 is therefore inhibition of FHX (Accession NM\_018416). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX.

FLJ10079 (Accession XM\_012540) is another VGAM795 host target gene. FLJ10079 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10079 BINDING SITE, designated SEQ ID:30217, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30914] Another function of VGAM795 is therefore inhibition of FLJ10079 (Accession XM\_012540). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10079. FLJ20371 (Accession NM\_017791) is another VGAM795 host target gene. FLJ20371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20371 BINDING SITE, designated SEQ ID:19425, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3506.

[30915] Another function of VGAM795 is therefore inhibition of FLJ20371 (Accession NM\_017791). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20371. FLJ22408 (Accession NM\_024794) is another VGAM795 host target gene. FLJ22408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22408 BINDING SITE, designated SEQ ID:24174, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30916] Another function of VGAM795 is therefore inhibition of FLJ22408 (Accession NM\_024794). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22408. FLJ22471 (Accession NM\_025140) is another VGAM795 host target gene. FLJ22471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22471, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22471 BINDING SITE, designated SEQ ID:24779, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30917] Another function of VGAM795 is therefore inhibition of FLJ22471 (Accession NM\_025140). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22471. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM795 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28534, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30918] Another function of VGAM795 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A

(GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA0286 (Accession XM\_043118) is another VGAM795 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33908, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30919] Another function of VGAM795 is therefore inhibition of KIAA0286 (Accession XM\_043118). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0471 (Accession NM\_014857) is another VGAM795 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16917, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30920] Another function of VGAM795 is therefore inhibition of KIAA0471 (Accession NM\_014857). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA0523 (Accession XM\_041964) is another VGAM795 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33649, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30921] Another function of VGAM795 is therefore inhibition of KIAA0523 (Accession XM\_041964). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA0560 (Accession XM\_029045) is another

VGAM795 host target gene. KIAA0560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0560 BINDING SITE, designated SEQ ID:30839, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30922] Another function of VGAM795 is therefore inhibition of KIAA0560 (Accession XM\_029045). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0560. KIAA1069 (Accession XM\_042635) is another VGAM795 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33727, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30923] Another function of VGAM795 is therefore inhibition of KIAA1069 (Accession XM\_042635). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM795 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32724, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30924] Another function of VGAM795 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. PFTK1 Protein Kinase 1 (PFTK1, Accession NM\_012395) is another VGAM795 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFTK1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14755, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30925] Another function of VGAM795 is therefore inhibition of PFTK1 Protein Kinase 1 (PFTK1, Accession NM\_012395). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. PRO2893 (Accession NM\_018634) is another VGAM795 host target gene. PRO2893 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2893 BINDING SITE, designated SEQ ID:20705, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30926] Another function of VGAM795 is therefore inhibition of PRO2893 (Accession NM\_018634). Accordingly, utilities of

VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2893. ZFP (Accession NM\_018651) is another VGAM795 host target gene. ZFP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP BINDING SITE, designated SEQ ID:20721, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30927] Another function of VGAM795 is therefore inhibition of ZFP (Accession NM\_018651). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP. LOC124599 (Accession XM\_064218) is another VGAM795 host target gene. LOC124599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124599 BINDING SITE, designated SEQ ID:37258, to the nucleotide se-

quence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30928] Another function of VGAM795 is therefore inhibition of LOC124599 (Accession XM\_064218). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124599. LOC145622 (Accession XM\_085186) is another VGAM795 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37909, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30929] Another function of VGAM795 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC148479 (Accession XM\_086204) is another VGAM795 host target gene. LOC148479 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC148479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148479 BINDING SITE, designated SEQ ID:38544, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30930] Another function of VGAM795 is therefore inhibition of LOC148479 (Accession XM\_086204). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148479. LOC151996 (Accession XM\_098151) is another VGAM795 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41418, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30931] Another function of VGAM795 is therefore inhibition of LOC151996 (Accession XM\_098151). Accordingly, utilities

of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC152674 (Accession XM\_098251) is another VGAM795 host target gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41540, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30932] Another function of VGAM795 is therefore inhibition of LOC152674 (Accession XM\_098251). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC154743 (Accession XM\_088029) is another VGAM795 host target gene. LOC154743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154743 BINDING SITE, designated SEQ ID:39482, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30933] Another function of VGAM795 is therefore inhibition of LOC154743 (Accession XM\_088029). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154743. LOC163231 (Accession XM\_092094) is another VGAM795 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40102, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30934] Another function of VGAM795 is therefore inhibition of LOC163231 (Accession XM\_092094). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC200845 (Accession XM\_114305) is another VGAM795 host target gene. LOC200845 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200845 BINDING SITE, designated SEQ ID:42865, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30935] Another function of VGAM795 is therefore inhibition of LOC200845 (Accession XM\_114305). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200845. LOC219700 (Accession XM\_167570) is another VGAM795 host target gene. LOC219700 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219700 BINDING SITE, designated SEQ ID:44703, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30936] Another function of VGAM795 is therefore inhibition of

LOC219700 (Accession XM\_167570). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219700. LOC221468 (Accession NM\_145316) is another VGAM795 host target gene. LOC221468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221468 BINDING SITE, designated SEQ ID:29828, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30937] Another function of VGAM795 is therefore inhibition of LOC221468 (Accession NM\_145316). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221468. LOC254042 (Accession XM\_171022) is another VGAM795 host target gene. LOC254042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254042 BINDING SITE, designated SEQ ID:45792, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30938] Another function of VGAM795 is therefore inhibition of LOC254042 (Accession XM\_171022). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254042. LOC90075 (Accession XM\_028742) is another VGAM795 host target gene. LOC90075 BINDING SITE1 and LOC90075 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC90075, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90075 BINDING SITE1 and LOC90075 BINDING SITE2, designated SEQ ID:30738 and SEQ ID:30740 respectively, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30939] Another function of VGAM795 is therefore inhibition of LOC90075 (Accession XM\_028742). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC90075. LOC90982 (Accession XM\_035332) is another VGAM795 host target gene. LOC90982 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90982 BINDING SITE, designated SEQ ID:32235, to the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30940] Another function of VGAM795 is therefore inhibition of LOC90982 (Accession XM\_035332). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90982. LOC92391 (Accession XM\_044793) is another VGAM795 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:34274, to the

nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, also designated SEQ ID:3506.

[30941] Another function of VGAM795 is therefore inhibition of LOC92391 (Accession XM\_044793). Accordingly, utilities of VGAM795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 796 (VGAM796) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30942] VGAM796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM796 was detected is described hereinabove with reference to Figs. 1–8.

[30943] VGAM796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30944] VGAM796 gene encodes a VGAM796 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM796 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM796 precursor RNA is designated SEQ ID:782, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:782 is located at position 85864 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30945] VGAM796 precursor RNA folds onto itself, forming VGAM796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30946] An enzyme complex designated DICER COMPLEX, `dices` the VGAM796 folded precursor RNA into VGAM796 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM796 RNA is designated SEQ ID:3507, and is provided hereinbelow with reference to the sequence listing part.

[30947] VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM796 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30948] VGAM796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM796 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM796 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[30949] The complementary binding of VGAM796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM796 host target RNA into VGAM796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30950] It is appreciated that VGAM796 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM796 host target genes. The mRNA of each one of this plurality of VGAM796 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM796 RNA, herein designated VGAM RNA, and which when bound by VGAM796 RNA causes inhibition of translation of respective one or more VGAM796 host target proteins.

[30951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM796 gene, herein designated VGAM GENE, on one or more VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[30952] It is yet further appreciated that a function of VGAM796 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM796 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM796 correlate with, and may be deduced from, the identity of the host target genes which VGAM796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30953] Nucleotide sequences of the VGAM796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM796 are further described hereinbelow with reference to Table 1.

[30954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM796 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM796 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30955] As mentioned hereinabove with reference to Fig. 1, a function of VGAM796 gene, herein designated VGAM is inhibition of expression of VGAM796 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM796 correlate with, and may be deduced from, the identity of the target genes which VGAM796 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30956] FLJ10842 (Accession NM\_018238) is a VGAM796 host target gene. FLJ10842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10842 BINDING SITE, designated SEQ ID:20186, to the nucleotide sequence of VGAM796 RNA, herein designated VGAM RNA, also designated SEQ ID:3507.

[30957] A function of VGAM796 is therefore inhibition of FLJ10842 (Accession NM\_018238). Accordingly, utilities of VGAM796 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10842. LOC202309 (Accession XM\_117375) is another VGAM796 host target gene. LOC202309 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202309 BINDING SITE, designated SEQ ID:43421, to the nucleotide sequence of VGAM796 RNA, herein designated VGAM RNA, also designated SEQ ID:3507.

[30958] Another function of VGAM796 is therefore inhibition of LOC202309 (Accession XM\_117375). Accordingly, utilities of VGAM796 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202309. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 797 (VGAM797) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[30959] VGAM797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM797 was detected is described hereinabove with reference to Figs. 1–8.

[30960] VGAM797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30961] VGAM797 gene encodes a VGAM797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM797 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM797 precursor RNA is designated SEQ ID:783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:783 is located at position 100499 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30962] VGAM797 precursor RNA folds onto itself, forming

VGAM797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30963] An enzyme complex designated DICER COMPLEX, `dices` the VGAM797 folded precursor RNA into VGAM797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM797 RNA is designated SEQ ID:3508, and is provided hereinbelow with reference to the sequence listing part.

[30964] VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM797 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30965] VGAM797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM797 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM797 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[30966] The complementary binding of VGAM797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM797 host target RNA into VGAM797 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[30967] It is appreciated that VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM797 host target genes. The mRNA of each one of this plurality of VGAM797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM797 RNA, herein designated VGAM RNA, and which when bound by VGAM797 RNA causes inhibition of translation of respective one or more VGAM797 host target proteins.

[30968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM797 gene, herein designated VGAM GENE, on one or more VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[30969] It is yet further appreciated that a function of VGAM797 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM797 correlate with, and may be deduced from, the identity of the host

target genes which VGAM797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[30970] Nucleotide sequences of the VGAM797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM797 are further described hereinbelow with reference to Table 1.

[30971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM797 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[30972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM797 gene, herein designated VGAM is inhibition of expression of VGAM797 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM797 correlate with, and may be deduced from, the identity of the target genes which VGAM797

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[30973] Endothelin Receptor Type A (EDNRA, Accession XM\_034331) is a VGAM797 host target gene. EDNRA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDNRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRA BINDING SITE, designated SEQ ID:32058, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30974] A function of VGAM797 is therefore inhibition of Endothelin Receptor Type A (EDNRA, Accession XM\_034331), a gene which binds endothelins, and induces intracellular calcium flux and arachidonic acid accumulation. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDNRA. The function of EDNRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM441. Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053) is another

VGAM797 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32995, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30975] Another function of VGAM797 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359. GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM\_000161) is another VGAM797 host target gene. GCH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GCH1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCH1 BINDING SITE, designated SEQ ID:5668, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30976] Another function of VGAM797 is therefore inhibition of GTP Cyclohydrolase 1 (dopa-responsive dystonia) (GCH1, Accession NM\_000161). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCH1. Neuroligin 1 (NLGN1, Accession NM\_014932) is another VGAM797 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:17231, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30977] Another function of VGAM797 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM\_014932), a gene which may trigger the de novo formation of presynaptic

structure. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN1. The function of NLGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM659. Regulatory Factor X-associated Protein (RFXAP, Accession NM\_000538) is another VGAM797 host target gene. RFXAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RFXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFXAP BINDING SITE, designated SEQ ID:6136, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30978] Another function of VGAM797 is therefore inhibition of Regulatory Factor X-associated Protein (RFXAP, Accession NM\_000538), a gene which binds to the x-box of mhc ii promoters and is a transcriptional regulator. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with RFXAP. The function of RFXAP has been established by previous studies. Yanagisawa et al. (2000) isolated and analyzed a gene that shares a notable motif with DRPLA, namely that of arginine–glutamic acid (RE) dipeptide repeats. The gene that was isolated, designated RERE, has an open reading frame of 1,566 amino acids, of which the C-terminal portion has 67% homology to DRPLA, whereas the N-terminal portion is distinctive. RERE also contains arginine–aspartic acid (RD) dipeptide repeats and putative nuclear localization signal sequences, but no polyglutamine tracts. Northern blot analysis detected 2 RERE transcripts: one of 9 kb, expressed exclusively in pancreas and testis; and one of 7 kb, expressed most strongly in skeletal muscle with weaker expression in other tissues tested, including brain. The RERE protein migrated at an apparent molecular weight of 212 kD in SDS–PAGE. An RERE fusion protein localized predominantly in the nucleus. Immunoprecipitation and in vitro binding assays demonstrated that the DRPLA and RERE proteins bind each other, which is facilitated by one of the RE repeats, and that extension of the DRPLA polyglutamine tract enhances the binding. By study of a YAC spanning a translocation/duplication breakpoint within the minimally defined loss of

heterozygosity region at 1p36.2–p36.1 in a neuroblastoma cell line, Amler et al. (2000) identified the RERE gene, which they designated DNB1/ARP (deleted in neuroblastoma–1/atrophin–related protein

[30979] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[30980] Amler, L. C.; Bauer, A.; Corvi, R.; Dihlmann, S.; Praml, C.; Cavenee, W. K.; Schwab, M.; Hampton, G. M. : Identification and characterization of novel genes located at the t(1;15)(p36.2;q24) translocation breakpoint in the neuroblastoma cell line NGP. Genomics 64: 195–202, 2000. ; and

[30981] Yanagisawa, H.; Bundo, M.; Miyashita, T.; Okamura–Oho, Y.; Tadokoro, K.; Tokunaga, K.; Yamada, M. : Protein binding of a DRPLA family through arginine–glutamic acid dipeptide repeats i.

[30982] Further studies establishing the function and utilities of RFXAP are found in John Hopkins OMIM database record ID 601861, and in cited publications numbered 5800–5801, 8317–580 and 6077 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine Racemase (SRR, Accession

NM\_021947) is another VGAM797 host target gene. SRR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRR BINDING SITE, designated SEQ ID:22473, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30983] Another function of VGAM797 is therefore inhibition of Serine Racemase (SRR, Accession NM\_021947). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRR. Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM\_003149) is another VGAM797 host target gene. STAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAC BINDING SITE, designated SEQ ID:9120, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3508.

[30984] Another function of VGAM797 is therefore inhibition of Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM\_003149), a gene which is probably involved in a neuron-specific signal transduction. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAC. The function of STAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331.FLJ10922 (Accession NM\_018273) is another VGAM797 host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20256, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30985] Another function of VGAM797 is therefore inhibition of FLJ10922 (Accession NM\_018273). Accordingly, utilities of

VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. KIAA1900 (Accession XM\_055299) is another VGAM797 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36261, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30986] Another function of VGAM797 is therefore inhibition of KIAA1900 (Accession XM\_055299). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. MEGF11 (Accession NM\_032445) is another VGAM797 host target gene. MEGF11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEGF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF11

BINDING SITE, designated SEQ ID:26206, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30987] Another function of VGAM797 is therefore inhibition of MEGF11 (Accession NM\_032445). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF11. Rab11-FIP2 (Accession NM\_014904) is another VGAM797 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17100, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30988] Another function of VGAM797 is therefore inhibition of Rab11-FIP2 (Accession NM\_014904). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958) is another VGAM797 host target

gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10096, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30989] Another function of VGAM797 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. LOC146894 (Accession NM\_145273) is another VGAM797 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29782, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30990] Another function of VGAM797 is therefore inhibition of LOC146894 (Accession NM\_145273). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC168391 (Accession XM\_095061) is another VGAM797 host target gene. LOC168391 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168391 BINDING SITE, designated SEQ ID:40244, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30991] Another function of VGAM797 is therefore inhibition of LOC168391 (Accession XM\_095061). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168391. LOC255328 (Accession XM\_172920) is another VGAM797 host target gene. LOC255328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255328, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:46179, to the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, also designated SEQ ID:3508.

[30992] Another function of VGAM797 is therefore inhibition of LOC255328 (Accession XM\_172920). Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 798 (VGAM798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[30993] VGAM798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM798 was detected is described hereinabove with reference to Figs. 1–8.

[30994] VGAM798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM798 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[30995] VGAM798 gene encodes a VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM798 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM798 precursor RNA is designated SEQ ID:784, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:784 is located at position 102198 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[30996] VGAM798 precursor RNA folds onto itself, forming VGAM798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[30997] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM798 folded precursor RNA into VGAM798 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM798 RNA is designated SEQ ID:3509, and is provided hereinbelow with reference to the sequence listing part.

[30998] VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM798 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[30999] VGAM798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM798 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM798 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31000] The complementary binding of VGAM798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM798 host target RNA into VGAM798 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31001] It is appreciated that VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM798 host target genes. The mRNA of each one of this plurality of VGAM798 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM798 RNA, herein designated VGAM RNA, and which when bound by VGAM798 RNA causes inhibition of translation of respective one or more VGAM798 host target proteins.

[31002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM798 gene, herein designated VGAM GENE, on one or more VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31003] It is yet further appreciated that a function of VGAM798 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM798 correlate with, and may be deduced from, the identity of the host target genes which VGAM798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31004] Nucleotide sequences of the VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM798 are further

described hereinbelow with reference to Table 1.

[31005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM798 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31006] As mentioned hereinabove with reference to Fig. 1, a function of VGAM798 gene, herein designated VGAM is inhibition of expression of VGAM798 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM798 correlate with, and may be deduced from, the identity of the target genes which VGAM798 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31007] Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078) is a VGAM798 host target gene. CSRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of CSRP1 BINDING SITE, designated SEQ ID:10280, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31008] A function of VGAM798 is therefore inhibition of Cysteine and Glycine-rich Protein 1 (CSRP1, Accession NM\_004078), a gene which could play a role in neuronal development. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP1. The function of CSRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743. Cullin 5 (CUL5, Accession NM\_003478) is another VGAM798 host target gene. CUL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL5 BINDING SITE, designated SEQ ID:9548, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31009] Another function of VGAM798 is therefore inhibition of

Cullin 5 (CUL5, Accession NM\_003478), a gene which may target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL5. The function of CUL5 has been established by previous studies. The arginine vasopressin (AVP)-activated calcium-mobilizing receptor (OMIM Ref. No. VACM-1) is a cell surface protein involved in intracellular signal transduction. The gene encoding rabbit VACM-1 was isolated by Burnatowska-Hledin et al. (1995) from a renal medullary cDNA library by expression cloning in *Xenopus laevis* oocytes. While searching for expressed genes in the ataxia-telangiectasia (OMIM Ref. No. 208900) gene region on chromosome 11q22-q23, Byrd et al. (1997) identified the gene encoding the human homolog of rabbit VACM-1 and determined the complete amino acid sequence for the protein. The 780-amino acid predicted polypeptide differs from the rabbit sequence by only 7 residues. Northern hybridization analysis showed expression in a wide range of human tissues. Byrd et al. (1997) noted that the human VACM1 gene shares homology with the *C. elegans* gene *Ce-cul-5*, a member of the family of cullin genes that are involved in cell cycle regu-

lation.

- [31010] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [31011] Burnatowska-Hledin, M. A.; Spielman, W. S.; Smith, W. L.; Shi, P.; Meyer, J. M.; Dewitt, D. L. : Expression cloning of an AVP-activated, calcium-mobilizing receptor from rabbit kidney medulla. *Am. J. Physiol.* 268: F1198–F1210, 1995. ; and
- [31012] Byrd, P. J.; Stankovic, T.; McConville, C. M.; Smith, A. D.; Cooper, P. R.; Taylor, A. M. R. : Identification and analysis of expression of human VACM-1, a cullin gene family member loc.
- [31013] Further studies establishing the function and utilities of CUL5 are found in John Hopkins OMIM database record ID 601741, and in cited publications numbered 6200–6201 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778) is another VGAM798 host target gene. CYP4A11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP4A11, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4A11 BINDING SITE, designated SEQ ID:6420, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31014] Another function of VGAM798 is therefore inhibition of Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778), a gene which catalyzes the omega- and (omega-1)-hydroxylation of various fatty acids . Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4A11. The function of CYP4A11 has been established by previous studies. The human P450 enzymes encoded by CYP4 genes (see OMIM Ref. No. 124075) represent a distinct lineage of the P450 family. Palmer et al. (1993) noted that mammalian CYP4A enzymes catalyze selective hydroxylation of a primary carbon-hydrogen bond in medium- and long-chain fatty acids. Palmer et al. (1993) cloned and characterized a CYP4A-encoding gene (designated CYP4AII by them) by screening a human kidney cDNA library using a rabbit CYP4A cDNA probe. By Northern and RNase protection

analysis, they showed that the gene (also symbolized CYP4A11) is expressed predominantly in kidney and somewhat in liver. Palmer et al. (1993) characterized the catalytic activity of expressed recombinant CYP4A11 on various fatty acids and prostaglandins and concluded that the enzyme is a fatty acid omega-hydroxylase with turnover numbers of 9.8, 2.2, and 0.55 per min for lauric, palmitic, and arachidonic acids, respectively Imaoka et al. (1993) cloned a variant cDNA of CYP4A11, called CYP4A11v, from a human kidney cDNA library. The CYP4A11v cDNA contains a deletion of a single adenine residue, resulting in a frameshift and the production of a predicted 591-amino acid protein. Several differences in the 3-prime untranslated region of the CYP4A11v cDNA were also detected. Baculovirus-mediated expression of the CYP4A11v cDNA yielded an unstable protein that did not efficiently metabolize lauric acid.

[31015] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31016] Imaoka, S.; Ogawa, H.; Kimura, S.; Gonzalez, F. J. : Complete cDNA sequence and cDNA-directed expression of CYP4A11, a fatty acid omega-hydroxylase expressed in

human kidney. DNA Cell Biol. 12: 893–899, 1993. ; and

[31017] Kawashima, H.; Kusunose, E.; Kikuta, Y.; Kinoshita, H.; Tanaka, S.; Yamamoto, S.; Kishimoto, T.; Kusunose, M. : Purification and cDNA cloning of human liver CYP4A fatty acid omega-hydro.

[31018] Further studies establishing the function and utilities of CYP4A11 are found in John Hopkins OMIM database record ID 601310, and in cited publications numbered 7041–7044 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Dehydrogenase 1 (GLUD1, Accession NM\_005271) is another VGAM798 host target gene. GLUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUD1 BINDING SITE, designated SEQ ID:11776, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31019] Another function of VGAM798 is therefore inhibition of Glutamate Dehydrogenase 1 (GLUD1, Accession

NM\_005271). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUD1. Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM\_133631) is another VGAM798 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:28590 and SEQ ID:8853 respectively, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31020] Another function of VGAM798 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM\_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM37.Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM\_003053) is another VGAM798 host target gene. SLC18A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC18A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC18A1 BINDING SITE, designated SEQ ID:9018, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31021] Another function of VGAM798 is therefore inhibition of Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM\_003053), a gene which is involved in the vesicular transport of biogenic amines. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC18A1. The function of SLC18A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.FLJ11539

(Accession NM\_024748) is another VGAM798 host target gene. FLJ11539 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:24090, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31022] Another function of VGAM798 is therefore inhibition of FLJ11539 (Accession NM\_024748). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539. FLJ14326 (Accession NM\_032191) is another VGAM798 host target gene. FLJ14326 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14326 BINDING SITE, designated SEQ ID:25906, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3509.

[31023] Another function of VGAM798 is therefore inhibition of FLJ14326 (Accession NM\_032191). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326. KIAA0057 (Accession NM\_012288) is another VGAM798 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14628, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31024] Another function of VGAM798 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0961 (Accession NM\_014898) is another VGAM798 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0961, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17073, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31025] Another function of VGAM798 is therefore inhibition of KIAA0961 (Accession NM\_014898). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. LHX6 (Accession NM\_014368) is another VGAM798 host target gene. LHX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:15700, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31026] Another function of VGAM798 is therefore inhibition of LHX6 (Accession NM\_014368). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LHX6.

MGC5139 (Accession XM\_058587) is another VGAM798 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36680, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31027] Another function of VGAM798 is therefore inhibition of MGC5139 (Accession XM\_058587). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. PFTAIRE Protein Kinase 1 (PFTK1, Accession NM\_012395) is another VGAM798 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14756, to the

nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31028] Another function of VGAM798 is therefore inhibition of PFTAIK Protein Kinase 1 (PFTK1, Accession NM\_012395). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. LOC133418 (Accession XM\_059649) is another VGAM798 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37043, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31029] Another function of VGAM798 is therefore inhibition of LOC133418 (Accession XM\_059649). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC51696 (Accession NM\_016217) is another VGAM798 host target gene. LOC51696 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18317, to the nucleotide sequence of VGAM798 RNA, herein designated VGAM RNA, also designated SEQ ID:3509.

[31030] Another function of VGAM798 is therefore inhibition of LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 799 (VGAM799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31031] VGAM799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM799 was detected is described hereinabove with reference to Figs. 1-8.

[31032] VGAM799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31033] VGAM799 gene encodes a VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM799 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM799 precursor RNA is designated SEQ ID:785, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:785 is located at position 181145 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[31034] VGAM799 precursor RNA folds onto itself, forming VGAM799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31035] An enzyme complex designated DICER COMPLEX, `dices` the VGAM799 folded precursor RNA into VGAM799 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM799 RNA is designated SEQ ID:3510, and is provided hereinbelow with reference to the sequence listing part.

[31036] VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM799 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31037] VGAM799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM799 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31038] The complementary binding of VGAM799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM799 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM799 host target RNA into VGAM799 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31039] It is appreciated that VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM799 host target genes. The mRNA of each one of this plurality of VGAM799 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM799 RNA, herein designated VGAM RNA, and which when bound by VGAM799 RNA causes inhibition of translation of respective one or more VGAM799 host target proteins.

[31040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM799 gene, herein designated VGAM GENE, on one or more VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31041] It is yet further appreciated that a function of VGAM799 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM799 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM799 correlate with, and may be deduced from, the identity of the host target genes which VGAM799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31042] Nucleotide sequences of the VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM799 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM799 are further described hereinbelow with reference to Table 1.

[31043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM799 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31044] As mentioned hereinabove with reference to Fig. 1, a function of VGAM799 gene, herein designated VGAM is inhibition of expression of VGAM799 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM799 correlate with, and may be deduced from, the identity of the target genes which VGAM799 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31045] Ankyrin 1, Erythrocytic (ANK1, Accession NM\_000037) is a VGAM799 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1,

corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:5474, SEQ ID:21727 and SEQ ID:30277 respectively, to the nucleotide sequence of VGAM799 RNA, herein designated VGAM RNA, also designated SEQ ID:3510.

[31046] A function of VGAM799 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession NM\_000037). Accordingly, utilities of VGAM799 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. KIAA1796 (Accession XM\_166146) is another VGAM799 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43962, to the nucleotide sequence of VGAM799 RNA, herein designated VGAM RNA, also designated SEQ ID:3510.

[31047] Another function of VGAM799 is therefore inhibition of

KIAA1796 (Accession XM\_166146). Accordingly, utilities of VGAM799 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 800 (VGAM800) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31048] VGAM800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM800 was detected is described hereinabove with reference to Figs. 1–8.

[31049] VGAM800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31050] VGAM800 gene encodes a VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM800 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM800 precursor RNA is designated SEQ ID:786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:786 is located at position 181601 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[31051] VGAM800 precursor RNA folds onto itself, forming VGAM800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM800 folded precursor RNA into VGAM800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 74%) nucleotide sequence of VGAM800 RNA is designated SEQ ID:3511, and is provided hereinbelow with reference to the sequence listing part.

[31053] VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM800 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[31054] VGAM800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM800 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31055] The complementary binding of VGAM800 RNA, herein designated VGAM RNA, to host target binding sites on VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM800 host target RNA into VGAM800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31056] It is appreciated that VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM800 host target genes. The mRNA of each one of this plurality of VGAM800 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM800 RNA, herein designated VGAM RNA, and which when bound by VGAM800 RNA causes inhibition of translation of respective one or more VGAM800 host target proteins.

[31057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM800 gene, herein designated VGAM GENE, on one or more VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31058] It is yet further appreciated that a function of VGAM800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM800 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM800 correlate with, and may be deduced from, the identity of the host target genes which VGAM800 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31059] Nucleotide sequences of the VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM800 are further described hereinbelow with reference to Table 1.

[31060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM800 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM800 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[31061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM800 gene, herein designated VGAM is inhibition of expression of VGAM800 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM800 correlate with, and may be deduced from, the identity of the target genes which VGAM800 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31062] Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is a VGAM800 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12216, to the nucleotide sequence of VGAM800 RNA, herein designated VGAM RNA, also designated SEQ ID:3511.

[31063] A function of VGAM800 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM800 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with EVI5. KIAA1789 (Accession XM\_040486) is another VGAM800 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33314, to the nucleotide sequence of VGAM800 RNA, herein designated VGAM RNA, also designated SEQ ID:3511.

[31064] Another function of VGAM800 is therefore inhibition of KIAA1789 (Accession XM\_040486). Accordingly, utilities of VGAM800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. LOC221773 (Accession XM\_165802) is another VGAM800 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43763, to

the nucleotide sequence of VGAM800 RNA, herein designated VGAM RNA, also designated SEQ ID:3511.

[31065] Another function of VGAM800 is therefore inhibition of LOC221773 (Accession XM\_165802). Accordingly, utilities of VGAM800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 801 (VGAM801) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31066] VGAM801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM801 was detected is described hereinabove with reference to Figs. 1–8.

[31067] VGAM801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31068] VGAM801 gene encodes a VGAM801 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM801 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM801 precursor RNA is designated SEQ ID:787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:787 is located at position 962 relative to the genome of Murid Herpesvirus 4.

[31069] VGAM801 precursor RNA folds onto itself, forming VGAM801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31070] An enzyme complex designated DICER COMPLEX, `dices` the VGAM801 folded precursor RNA into VGAM801 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM801 RNA is designated SEQ ID:3512, and is provided hereinbelow with reference to the sequence listing part.

[31071] VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM801 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[31072] VGAM801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM801 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31073] The complementary binding of VGAM801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM801 host target RNA into VGAM801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31074] It is appreciated that VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM801 host target genes. The mRNA of each one of this plurality of VGAM801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM801 RNA, herein designated VGAM RNA, and which when bound by VGAM801 RNA causes inhibition of translation of respective one or more VGAM801 host target proteins.

[31075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM801 gene, herein designated VGAM GENE, on one or more VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[31076] It is yet further appreciated that a function of VGAM801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM801 correlate with, and may be deduced from, the identity of the host target genes which VGAM801 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31077] Nucleotide sequences of the VGAM801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM801 are further described hereinbelow with reference to Table 1.

[31078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM801 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31079] As mentioned hereinabove with reference to Fig. 1, a function of VGAM801 gene, herein designated VGAM is inhibition of expression of VGAM801 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM801 correlate with, and may be deduced from, the identity of the target genes which VGAM801 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31080] ATP10C (Accession NM\_024490) is a VGAM801 host target gene. ATP10C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:23685, to the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, also designated SEQ ID:3512.

[31081] A function of VGAM801 is therefore inhibition of ATP10C (Accession NM\_024490), a gene which is phosphorylated

in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10C. The function of ATP10C has been established by previous studies. Meguro et al. (2001) reported that the ATP10C gene is maternally expressed, that it maps within the most common interval of deletion responsible for Angelman syndrome (AS; 105830) (15q11–q13), and that ATP10C expression is virtually absent from Angelman syndrome patients with imprinting mutations, as well as from patients with maternal deletions of 15q11–q13. Previously, although AS patients infrequently have mutations in the UBE3A gene (OMIM Ref. No. 601623), which encodes a ubiquitin ligase required for long-term synaptic potentiation (LTP), most cases were attributable to de novo maternal deletions of the critical 15q region. Herzing et al. (2001) reported that ATP10C maps within 200 kb distal to UBE3A and, like UBE3A, demonstrates imprinted, preferential maternal expression in human brain. They suggested that ATP10C is a candidate for chromosome 15-associated autism as well as the Angelman syndrome phenotype. Animal model experiments lend further support to the function of ATP10C.

Dhar et al. (2000) reported that maternal inheritance of deletions of the mouse Atp10c gene resulted in increased body fat. The obese phenotype was consistently observed in the mouse model for Angelman syndrome with paternal uniparental disomy (Cattanach et al., 1997). Meguro et al. (2001) speculated that ATP10C may be an aminophospholipid translocase involved in phospholipid transport.

[31082] It is appreciated that the abovementioned animal model for ATP10C is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[31083] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31084] Meguro, M.; Kashiwagi, A.; Mitsuya, K.; Nakao, M.; Kondo, I.; Saitoh, S.; Oshimura, M. : A novel maternally expressed gene, ATP10C, encodes a putative aminophospholipid translocase associated with Angelman syndrome. *Nature Genet.* 28: 19–20, 2001. ; and

[31085] Cattanach, B. M.; Barr, J. A.; Beechey, C. V.; Martin, J.; Noebels, J.; Jones, J. : A candidate model for Angelman syndrome in the mouse. *Mammalian Genome* 8: 472–478, 1997.

[31086] Further studies establishing the function and utilities of ATP10C are found in John Hopkins OMIM database record ID 605855, and in cited publications numbered 6621–6622, 12269, 676 and 6779 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215) is another VGAM801 host target gene. MGEA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA5 BINDING SITE, designated SEQ ID:14516, to the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, also designated SEQ ID:3512.

[31087] Another function of VGAM801 is therefore inhibition of Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215), a gene which has a hyaluronidase activity. Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA5. The function of MGEA5 has been established by previous studies. By screening a

meningioma expression library with autologous serum, Heckel et al. (1998) identified 4 cDNA clones representing a novel gene, which they designated meningioma-expressed antigen-5, with striking homology to *C. elegans* hyaluronidase. MGEA5 was noted to have hyaluronidase activity, but was otherwise not characterized. By sequencing randomly selected cDNAs corresponding to relatively long transcripts from human brain, Ishikawa et al. (1998) isolated an MGEA5 cDNA, which they designated KIAA0679, encoding a deduced 767-amino acid protein.

[31088] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31089] Heckel, D.; Comtesse, N.; Brass, N.; Blin, N.; Zang, K. D.; Meese, E. : Novel immunogenic antigen homologous to hyaluronidase in meningioma. *Hum. Molec. Genet.* 7: 1859-1872, 1998. ; and

[31090] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequences.

[31091] Further studies establishing the function and utilities of MGEA5 are found in John Hopkins OMIM database record

ID 604039, and in cited publications numbered 820 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MSTP032 (Accession NM\_025226) is another VGAM801 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24903, to the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, also designated SEQ ID:3512.

[31092] Another function of VGAM801 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. TED (Accession NM\_015686) is another VGAM801 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TED BINDING SITE, designated SEQ ID:17910, to the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, also designated SEQ ID:3512.

[31093] Another function of VGAM801 is therefore inhibition of TED (Accession NM\_015686). Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. LOC151126 (Accession XM\_087103) is another VGAM801 host target gene. LOC151126 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151126 BINDING SITE, designated SEQ ID:39055, to the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, also designated SEQ ID:3512.

[31094] Another function of VGAM801 is therefore inhibition of LOC151126 (Accession XM\_087103). Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151126. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 802 (VGAM802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31095] VGAM802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM802 was detected is described hereinabove with reference to Figs. 1–8.

[31096] VGAM802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31097] VGAM802 gene encodes a VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM802 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM802 precursor RNA is designated SEQ ID:788, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:788 is

located at position 638 relative to the genome of Murid Herpesvirus 4.

[31098] VGAM802 precursor RNA folds onto itself, forming VGAM802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31099] An enzyme complex designated DICER COMPLEX, `dices` the VGAM802 folded precursor RNA into VGAM802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM802 RNA is designated SEQ ID:3513, and is provided hereinbelow with reference to the sequence listing part.

[31100] VGAM802 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM802 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31101] VGAM802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM802 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM802 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31102] The complementary binding of VGAM802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM802 host target RNA into VGAM802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31103] It is appreciated that VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM802 host target genes. The mRNA of each one of this plurality of VGAM802 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM802 RNA, herein designated VGAM RNA, and which when bound by VGAM802 RNA causes inhibition of translation of respective one or more VGAM802

host target proteins.

[31104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM802 gene, herein designated VGAM GENE, on one or more VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31105] It is yet further appreciated that a function of VGAM802 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM802 correlate with, and may be deduced from, the identity of the host target genes which VGAM802 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31106] Nucleotide sequences of the VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM802 are further described hereinbelow with reference to Table 1.

[31107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM802 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31108] As mentioned hereinabove with reference to Fig. 1, a function of VGAM802 gene, herein designated VGAM is inhibition of expression of VGAM802 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM802 correlate with, and may be deduced from, the identity of the target genes which VGAM802 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31109] Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal) (CHRNA2, Accession NM\_000748) is a VGAM802 host target gene. CHRNA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHRNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA2 BINDING SITE, designated SEQ ID:6402, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31110] A function of VGAM802 is therefore inhibition of Cholinergic Receptor, Nicotinic, Beta Polypeptide 2 (neuronal) (CHRNA2, Accession NM\_000748), a gene which mediates fast signal transmission at synapses. Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA2. The function of CHRNA2 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM166. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935) is another VGAM802 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12569, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31111] Another function of VGAM802 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Thyroid

Hormone Receptor, Beta (erythroblastic leukemia viral (v-erb-a) Oncogene Homolog 2, Avian) (THRB, Accession NM\_000461) is another VGAM802 host target gene. THRB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by THRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THRB BINDING SITE, designated SEQ ID:6076, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31112] Another function of VGAM802 is therefore inhibition of Thyroid Hormone Receptor, Beta (erythroblastic leukemia viral (v-erb-a) Oncogene Homolog 2, Avian) (THRB, Accession NM\_000461). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THRB. FLJ11413 (Accession NM\_024554) is another VGAM802 host target gene. FLJ11413 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ11413 BINDING SITE, designated SEQ ID:23774, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31113] Another function of VGAM802 is therefore inhibition of FLJ11413 (Accession NM\_024554). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11413. Interleukin 14 (IL14, Accession XM\_170924) is another VGAM802 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45702, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31114] Another function of VGAM802 is therefore inhibition of Interleukin 14 (IL14, Accession XM\_170924). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. KIAA0916 (Accession NM\_015057) is another

VGAM802 host target gene. KIAA0916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0916 BINDING SITE, designated SEQ ID:17416, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31115] Another function of VGAM802 is therefore inhibition of KIAA0916 (Accession NM\_015057). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0916. KRT6IRS (Accession NM\_033448) is another VGAM802 host target gene. KRT6IRS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KRT6IRS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRT6IRS BINDING SITE, designated SEQ ID:27252, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31116] Another function of VGAM802 is therefore inhibition of KRT6IRS (Accession NM\_033448). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT6IRS. LOC137991 (Accession XM\_059934) is another VGAM802 host target gene. LOC137991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC137991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137991 BINDING SITE, designated SEQ ID:37114, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31117] Another function of VGAM802 is therefore inhibition of LOC137991 (Accession XM\_059934). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137991. LOC151234 (Accession XM\_087136) is another VGAM802 host target gene. LOC151234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151234, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151234 BINDING SITE, designated SEQ ID:39077, to the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, also designated SEQ ID:3513.

[31118] Another function of VGAM802 is therefore inhibition of LOC151234 (Accession XM\_087136). Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 803 (VGAM803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31119] VGAM803 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM803 was detected is described hereinabove with reference to Figs. 1–8.

[31120] VGAM803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM803 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[31121] VGAM803 gene encodes a VGAM803 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM803 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM803 precursor RNA is designated SEQ ID:789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:789 is located at position 201 relative to the genome of Murid Herpesvirus 4.

[31122] VGAM803 precursor RNA folds onto itself, forming VGAM803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31123] An enzyme complex designated DICER COMPLEX, `dices` the VGAM803 folded precursor RNA into VGAM803 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM803 RNA is designated SEQ ID:3514, and is provided hereinbelow with reference to the sequence listing part.

[31124] VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM803 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31125] VGAM803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM803 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31126] The complementary binding of VGAM803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM803 host target RNA into VGAM803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31127] It is appreciated that VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM803 host target genes. The mRNA of each one of this plurality of VGAM803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM803 RNA, herein designated VGAM RNA, and which when bound by VGAM803 RNA causes inhibition of translation of respective one or more VGAM803 host target proteins.

[31128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM803 gene, herein designated VGAM GENE, on one or more VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31129] It is yet further appreciated that a function of VGAM803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM803 correlate with, and may be deduced from, the identity of the host target genes which VGAM803 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31130] Nucleotide sequences of the VGAM803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM803 are further described hereinbelow with reference to Table 1.

[31131] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM803 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31132] As mentioned hereinabove with reference to Fig. 1, a function of VGAM803 gene, herein designated VGAM is inhibition of expression of VGAM803 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM803 correlate with, and may be deduced from, the identity of the target genes which VGAM803 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31133] Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is a VGAM803 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14416 and SEQ

ID:29084 respectively, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31134] A function of VGAM803 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437) is another VGAM803 host target gene. NCOA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA4 BINDING SITE, designated SEQ ID:11924, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31135] Another function of VGAM803 is therefore inhibition of Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437), a gene which Binds and activates androgen receptor (AR) in ligand-dependent manner. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA4. The function of NCOA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM803 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8507, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31136] Another function of VGAM803 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide

(PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM\_006926) is another VGAM803 host target gene. SFTPA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFTPA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFTPA2 BINDING SITE, designated SEQ ID:13807, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31137] Another function of VGAM803 is therefore inhibition of Surfactant, Pulmonary-associated Protein A2 (SFTPA2, Accession NM\_006926), a gene which plays a role in innate host defense in the lung. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFTPA2. The function of SFTPA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM148. Small Nuclear Ribonucleoprotein 70kDa Polypeptide (RNP antigen) (SNRP70, Accession XM\_085942) is another VGAM803 host target gene. SNRP70 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNRP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRP70 BINDING SITE, designated SEQ ID:38406, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31138] Another function of VGAM803 is therefore inhibition of Small Nuclear Ribonucleoprotein 70kDa Polypeptide (RNP antigen) (SNRP70, Accession XM\_085942), a gene which mediates the splicing of pre-mRNA by binding to the loop I region of U1-snRNA. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRP70. The function of SNRP70 has been established by previous studies. The series of reactions leading to the removal of intervening sequences from pre-mRNAs to yield mature mRNA occurs in a complex known as the spliceosome. The

spliceosome contains several small nuclear ribonucleo-protein complexes (OMIM Ref. No. snRNPs). One of these, the U1 snRNP, contains at least 3 specific proteins. For the largest of these, the 68-kD U1-snRNP protein, a cDNA has been isolated. By use of the cDNA clone and the study of somatic cell hybrids, Barton et al. (1987) demonstrated that the gene encoding this protein is located on chromosome 19. See also Spritz et al. (1987, 1987). Spritz et al. (1987, 1987) referred to the protein as U1-70K snRNP protein. They suggested that the actual size is probably 52 kD. The protein contains 3 regions similar to known nucleic acid-binding proteins, and it binds RNA in an in vitro assay. Multiple forms due to alternative splicing may exist, possibly with different functions in vivo. The human U1-70K snRNP protein is the major antigen recognized by anti-(U1)RNP sera from patients with autoimmune diseases. Montzka and Steitz (1988) demonstrated additional complexity of the human snRNPs and stated that there are at least 12 snRNPs. Spritz et al. (1990) mapped the SNRP70 gene to 19q13.3 by a combination of Southern analysis of DNAs from somatic cell hybrids and in situ hybridization. They reported that the gene is greater than 44 kb, with 11 exons. Nelissen et al. (1991) likewise mapped

the gene to 19q and concluded that it is present in single copy, but stated that it consists of 6 exons and is 14 to 16 kb long.

[31139] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31140] Montzka, K. A.; Steitz, J. A. : Additional low-abundance human small nuclear ribonucleoproteins: U11, U12, etc. Proc. Nat. Acad. Sci. 85: 8885–8889, 1988. ; and

[31141] Nelissen, R. L.; Sillekens, P. T.; Beijer, R. P.; Geurts van Kessel, A. H.; van Venrooij, W. J. : Structure, chromosomal localization and evolutionary conservation of the gene encoding.

[31142] Further studies establishing the function and utilities of SNRP70 are found in John Hopkins OMIM database record ID 180740, and in cited publications numbered 746–75 and 1549 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thromboxane A Synthase 1 (platelet, cytochrome P450, subfamily V) (TBXAS1, Accession NM\_030984) is another VGAM803 host target gene. TBXAS1 BINDING SITE1 and TBXAS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded

by TBXAS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXAS1 BINDING SITE1 and TBXAS1 BINDING SITE2, designated SEQ ID:25246 and SEQ ID:6732 respectively, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31143] Another function of VGAM803 is therefore inhibition of Thromboxane A Synthase 1 (platelet, cytochrome P450, subfamily V) (TBXAS1, Accession NM\_030984). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXAS1. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM\_017444) is another VGAM803 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18905, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3514.

[31144] Another function of VGAM803 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM\_017444). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. DKFZP586B2420 (Accession XM\_059482) is another VGAM803 host target gene. DKFZP586B2420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586B2420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586B2420 BINDING SITE, designated SEQ ID:37011, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31145] Another function of VGAM803 is therefore inhibition of DKFZP586B2420 (Accession XM\_059482). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586B2420. FLJ10044 (Accession NM\_017980) is another VGAM803 host target gene. FLJ10044 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ10044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10044 BINDING SITE, designated SEQ ID:19711, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31146] Another function of VGAM803 is therefore inhibition of FLJ10044 (Accession NM\_017980). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10044. FLJ11320 (Accession NM\_018389) is another VGAM803 host target gene. FLJ11320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20424, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31147] Another function of VGAM803 is therefore inhibition of FLJ11320 (Accession NM\_018389). Accordingly, utilities of

VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ21940 (Accession NM\_022828) is another VGAM803 host target gene. FLJ21940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21940 BINDING SITE, designated SEQ ID:23107, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31148] Another function of VGAM803 is therefore inhibition of FLJ21940 (Accession NM\_022828). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21940. FLJ23047 (Accession NM\_024548) is another VGAM803 host target gene. FLJ23047 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23047 BINDING SITE,

designated SEQ ID:23762, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31149] Another function of VGAM803 is therefore inhibition of FLJ23047 (Accession NM\_024548). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23047. FLJ23185 (Accession NM\_025056) is another VGAM803 host target gene. FLJ23185 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23185 BINDING SITE, designated SEQ ID:24653, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31150] Another function of VGAM803 is therefore inhibition of FLJ23185 (Accession NM\_025056). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23185. FLJ23309 (Accession NM\_024896) is another VGAM803 host target gene. FLJ23309 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ23309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23309 BINDING SITE, designated SEQ ID:24378, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31151] Another function of VGAM803 is therefore inhibition of FLJ23309 (Accession NM\_024896). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23309. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620) is another VGAM803 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35015, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31152] Another function of VGAM803 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. LOC144558 (Accession XM\_096629) is another VGAM803 host target gene. LOC144558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144558 BINDING SITE, designated SEQ ID:40437, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31153] Another function of VGAM803 is therefore inhibition of LOC144558 (Accession XM\_096629). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144558. LOC145371 (Accession XM\_085123) is another VGAM803 host target gene. LOC145371 BINDING SITE1 and LOC145371 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by LOC145371, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE1 and LOC145371 BINDING SITE2, designated SEQ ID:37848 and SEQ ID:37847 respectively, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31154] Another function of VGAM803 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC161742 (Accession XM\_091095) is another VGAM803 host target gene. LOC161742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161742 BINDING SITE, designated SEQ ID:40026, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31155] Another function of VGAM803 is therefore inhibition of

LOC161742 (Accession XM\_091095). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161742. LOC201191 (Accession XM\_117058) is another VGAM803 host target gene. LOC201191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201191 BINDING SITE, designated SEQ ID:43213, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31156] Another function of VGAM803 is therefore inhibition of LOC201191 (Accession XM\_117058). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201191. LOC221486 (Accession XM\_165760) is another VGAM803 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43740, to the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, also designated SEQ ID:3514.

[31157] Another function of VGAM803 is therefore inhibition of LOC221486 (Accession XM\_165760). Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 804 (VGAM804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31158] VGAM804 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM804 was detected is described hereinabove with reference to Figs. 1–8.

[31159] VGAM804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM804 host target gene, herein designated VGAM HOST TARGET GENE,

is a human gene contained in the human genome.

[31160] VGAM804 gene encodes a VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM804 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM804 precursor RNA is designated SEQ ID:790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:790 is located at position 229000 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[31161] VGAM804 precursor RNA folds onto itself, forming VGAM804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31162] An enzyme complex designated DICER COMPLEX, `dices` the VGAM804 folded precursor RNA into VGAM804 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM804 RNA is designated SEQ ID:3515, and is provided hereinbelow with reference to the sequence listing part.

[31163] VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM804 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31164] VGAM804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM804 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31165] The complementary binding of VGAM804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM804 host target RNA into VGAM804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31166] It is appreciated that VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM804 host target genes. The mRNA of each one of this plurality of VGAM804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM804 RNA, herein designated VGAM RNA, and which when bound by VGAM804 RNA causes inhibition of translation of respective one or more VGAM804 host target proteins.

[31167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM804 gene, herein designated VGAM GENE, on one or more VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31168] It is yet further appreciated that a function of VGAM804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM804 correlate with, and may be deduced from, the identity of the host target genes which VGAM804 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31169] Nucleotide sequences of the VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM804 are further described hereinbelow with reference to Table 1.

- [31170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM804 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM804 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [31171] As mentioned hereinabove with reference to Fig. 1, a function of VGAM804 gene, herein designated VGAM is inhibition of expression of VGAM804 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM804 correlate with, and may be deduced from, the identity of the target genes which VGAM804 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [31172] Caveolin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753) is a VGAM804 host target gene. CAV1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CAV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAV1 BINDING SITE, designated SEQ ID:7492, to the nucleotide

sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31173] A function of VGAM804 is therefore inhibition of Caveolin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753), a gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g-protein alpha subunits and can functionally regulate their activity. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV1. The function of CAV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. CD53 Antigen (CD53, Accession NM\_000560) is another VGAM804 host target gene. CD53 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD53, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD53 BINDING SITE, designated SEQ ID:6169, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31174] Another function of VGAM804 is therefore inhibition of CD53 Antigen (CD53, Accession NM\_000560). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD53. Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246) is another VGAM804 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15514, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31175] Another function of VGAM804 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The func-

tion of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_003583) is another VGAM804 host target gene. DYRK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE, designated SEQ ID:9634, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31176] Another function of VGAM804 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM\_003583). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. Eve, Even-skipped Homeo Box Homolog 1 (Drosophila) (EVX1, Accession NM\_001989) is another VGAM804 host target gene. EVX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by EVX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVX1 BINDING SITE, designated SEQ ID:7714, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31177] Another function of VGAM804 is therefore inhibition of Eve, Even-skipped Homeo Box Homolog 1 (Drosophila) (EVX1, Accession NM\_001989). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVX1. Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950) is another VGAM804 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10086, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31178] Another function of VGAM804 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231) is another VGAM804 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14888, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31179] Another function of VGAM804 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2,

Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Membrane-spanning 4-domains, Subfamily A, Member 2 (Fc fragment of IgE, high affinity I, receptor for; beta polypeptide) (MS4A2, Accession NM\_021950) is another VGAM804 host target gene. MS4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A2 BINDING SITE, designated SEQ ID:22478, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31180] Another function of VGAM804 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 2 (Fc fragment of IgE, high affinity I, receptor for; beta

polypeptide) (MS4A2, Accession NM\_021950), a gene which binds to the fc region of immunoglobulins epsilon. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A2. The function of MS4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636. Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768) is another VGAM804 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYEOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:29003, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31181] Another function of VGAM804 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768), a gene which is encoded by MYELOMA

OVEREXPRESSED GENE. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM471. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071) is another VGAM804 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15296, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31182] Another function of VGAM804 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM\_002730) is another VGAM804 host target gene. PRKACA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKACA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACA BINDING SITE, designated SEQ ID:8600, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31183] Another function of VGAM804 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM\_002730), a gene which phosphorylates target proteins on serine or threonine residues. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACA. The function of PRKACA and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM175.Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102) is another VGAM804 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14412, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31184] Another function of VGAM804 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.Selectin P Ligand (SELPLG, Accession XM\_006867) is another

VGAM804 host target gene. SELPLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELPLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELPLG BINDING SITE, designated SEQ ID:30018, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31185] Another function of VGAM804 is therefore inhibition of Selectin P Ligand (SELPLG, Accession XM\_006867), a gene which binds to p-, e- and l-selectins, which mediates the tethering and rolling of neutrophils and t-lymphocytes on endothelial cells. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELPLG. The function of SELPLG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Zinc Finger Protein 200 (ZNF200, Accession NM\_003454) is another VGAM804 host target gene. ZNF200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF200, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF200 BINDING SITE, designated SEQ ID:9505, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31186] Another function of VGAM804 is therefore inhibition of Zinc Finger Protein 200 (ZNF200, Accession NM\_003454). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF200. Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM\_168302) is another VGAM804 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45103, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31187] Another function of VGAM804 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession

XM\_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 has been established by previous studies. By screening a human insulinoma cDNA library with a degenerate oligonucleotide corresponding to the H/C linker sequence, Tommerup et al. (1993) isolated cDNAs potentially encoding zinc finger proteins. Tommerup and Vissing (1995) performed sequence analysis on a number of these cDNAs and identified several novel zinc finger protein genes, including ZNF36, which they called ZNF139. The ZNF139 cDNA predicts a protein belonging to the Kruppel family of zinc finger proteins. By isotopic in situ hybridization, Rousseau-Merck et al. (1995) mapped the ZNF36 gene, which they called KOX18, to 7q21-q22. From pulsed field gel electrophoresis studies, they showed that KOX18 is within less than 250 kb of KOX25 (ZNF38; 601261). Rousseau-Merck et al. (1995) tabulated 18 different KOX genes that had been located in pairs within 9 DNA fragments of 200 to 580 kb on 7 different chromosomes. By FISH, Tommerup and Vissing (1995) mapped the ZNF36 gene to 7q21.3-q22.1.

[31188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31189] Tommerup, N.; Vissing, H. : Isolation and fine mapping of 16 novel human zinc finger–encoding cDNAs identify putative candidate genes for developmental and malignant disorders. *Genomics* 27: 259–264, 1995. ; and

[31190] Rousseau–Merck, M.–F.; Duro, D.; Berger, R.; Thiesen, H. J. : Chromosomal localization of two KOX zinc finger genes on chromosome bands 7q21–q22. *Ann. Genet.* 38: 81–84, 1995.

[31191] Further studies establishing the function and utilities of ZNF36 are found in John Hopkins OMIM database record ID 601260, and in cited publications numbered 925 and 9255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AD034

(Accession NM\_031480) is another VGAM804 host target gene. AD034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AD034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD034 BINDING SITE, designated SEQ

ID:25560, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31192] Another function of VGAM804 is therefore inhibition of AD034 (Accession NM\_031480). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD034. Apolipoprotein L, 6 (APOL6, Accession NM\_030641) is another VGAM804 host target gene. APOL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL6 BINDING SITE, designated SEQ ID:24971, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31193] Another function of VGAM804 is therefore inhibition of Apolipoprotein L, 6 (APOL6, Accession NM\_030641). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL6. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082) is another VGAM804

host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37823, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31194] Another function of VGAM804 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. BCAA (Accession NM\_016374) is another VGAM804 host target gene. BCAA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCAA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAA BINDING SITE, designated SEQ ID:18510, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31195] Another function of VGAM804 is therefore inhibition of BCAA (Accession NM\_016374). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAA. Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714) is another VGAM804 host target gene. C20orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf13 BINDING SITE, designated SEQ ID:19299, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31196] Another function of VGAM804 is therefore inhibition of Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf13. C3F (Accession NM\_005768) is another VGAM804 host target gene. C3F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C3F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:12333, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31197] Another function of VGAM804 is therefore inhibition of C3F (Accession NM\_005768). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F. Cytoskeleton-associated Protein 4 (CKAP4, Accession NM\_006825) is another VGAM804 host target gene. CKAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP4 BINDING SITE, designated SEQ ID:13704, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31198] Another function of VGAM804 is therefore inhibition of Cytoskeleton-associated Protein 4 (CKAP4, Accession

NM\_006825). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP4. CRIPT (Accession XM\_057669) is another VGAM804 host target gene. CRIPT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIPT BINDING SITE, designated SEQ ID:36540, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31199] Another function of VGAM804 is therefore inhibition of CRIPT (Accession XM\_057669). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIPT. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989) is another VGAM804 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:15176 and SEQ ID:6464 respectively, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31200] Another function of VGAM804 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. DKFZP434D193 (Accession XM\_114297) is another VGAM804 host target gene. DKFZP434D193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434D193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D193 BINDING SITE, designated SEQ ID:42854, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31201] Another function of VGAM804 is therefore inhibition of DKFZP434D193 (Accession XM\_114297). Accordingly, utilities of VGAM804 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434D193. ESDN (Accession NM\_080927) is another VGAM804 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28153, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31202] Another function of VGAM804 is therefore inhibition of ESDN (Accession NM\_080927). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. FLJ10415 (Accession NM\_018089) is another VGAM804 host target gene. FLJ10415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10415 BINDING SITE, designated SEQ ID:19853, to the nucleotide sequence of

VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31203] Another function of VGAM804 is therefore inhibition of FLJ10415 (Accession NM\_018089). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10415. FLJ10743 (Accession NM\_018201) is another VGAM804 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20083, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31204] Another function of VGAM804 is therefore inhibition of FLJ10743 (Accession NM\_018201). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_021903) is another VGAM804 host target gene. GABBR1 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by GABBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE, designated SEQ ID:22421, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31205] Another function of VGAM804 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_021903). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. HRD1 (Accession XM\_045498) is another VGAM804 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34471, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31206] Another function of VGAM804 is therefore inhibition of

HRD1 (Accession XM\_045498). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. HSPC063 (Accession NM\_014155) is another VGAM804 host target gene. HSPC063 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC063 BINDING SITE, designated SEQ ID:15440, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31207] Another function of VGAM804 is therefore inhibition of HSPC063 (Accession NM\_014155). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC063. ICB-1 (Accession NM\_004848) is another VGAM804 host target gene. ICB-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICB-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ICB-1 BINDING SITE, designated SEQ ID:11260, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31208] Another function of VGAM804 is therefore inhibition of ICB-1 (Accession NM\_004848). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICB-1. KIAA0258 (Accession NM\_014785) is another VGAM804 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16653, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31209] Another function of VGAM804 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0326 (Accession XM\_034819) is another

VGAM804 host target gene. KIAA0326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0326 BINDING SITE, designated SEQ ID:32162, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31210] Another function of VGAM804 is therefore inhibition of KIAA0326 (Accession XM\_034819). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0326. KIAA0495 (Accession XM\_031397) is another VGAM804 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31368, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31211] Another function of VGAM804 is therefore inhibition of KIAA0495 (Accession XM\_031397). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA1332 (Accession XM\_048774) is another VGAM804 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35263, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31212] Another function of VGAM804 is therefore inhibition of KIAA1332 (Accession XM\_048774). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1962 (Accession XM\_088567) is another VGAM804 host target gene. KIAA1962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1962, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1962 BINDING SITE, designated SEQ ID:39835, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31213] Another function of VGAM804 is therefore inhibition of KIAA1962 (Accession XM\_088567). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1962. LAP1B (Accession XM\_035429) is another VGAM804 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:32265, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31214] Another function of VGAM804 is therefore inhibition of LAP1B (Accession XM\_035429). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B.

MGC15396 (Accession NM\_052855) is another VGAM804 host target gene. MGC15396 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15396 BINDING SITE, designated SEQ ID:27437, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31215] Another function of VGAM804 is therefore inhibition of MGC15396 (Accession NM\_052855). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15396. MGC29891 (Accession NM\_144618) is another VGAM804 host target gene. MGC29891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC29891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29440, to the nucleotide sequence of VGAM804 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3515.

[31216] Another function of VGAM804 is therefore inhibition of MGC29891 (Accession NM\_144618). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29891. MGC4549 (Accession NM\_032377) is another VGAM804 host target gene. MGC4549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4549 BINDING SITE, designated SEQ ID:26169, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31217] Another function of VGAM804 is therefore inhibition of MGC4549 (Accession NM\_032377). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4549. Neurogenic Differentiation 4 (NEUROD4, Accession NM\_021191) is another VGAM804 host target gene. NEUROD4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by NEUROD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEUROD4 BINDING SITE, designated SEQ ID:22169, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31218] Another function of VGAM804 is therefore inhibition of Neurogenic Differentiation 4 (NEUROD4, Accession NM\_021191). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEUROD4. PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM\_015148) is another VGAM804 host target gene. PASK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PASK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:17504, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31219] Another function of VGAM804 is therefore inhibition of

PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM\_015148). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK. Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650) is another VGAM804 host target gene. PPP4R1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP4R1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1L BINDING SITE, designated SEQ ID:38819, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31220] Another function of VGAM804 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM\_086650). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1L. PRO2214 (Accession NM\_018517) is another VGAM804 host target gene. PRO2214 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by PRO2214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2214 BINDING SITE, designated SEQ ID:20590, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31221] Another function of VGAM804 is therefore inhibition of PRO2214 (Accession NM\_018517). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2214. SBB103 (Accession NM\_005785) is another VGAM804 host target gene. SBB103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBB103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBB103 BINDING SITE, designated SEQ ID:12365, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31222] Another function of VGAM804 is therefore inhibition of SBB103 (Accession NM\_005785). Accordingly, utilities of

VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBB103. Solute Carrier Family 25, (mitochondrial carrier), Member 18 (SLC25A18, Accession NM\_031481) is another VGAM804 host target gene. SLC25A18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A18 BINDING SITE, designated SEQ ID:25562, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31223] Another function of VGAM804 is therefore inhibition of Solute Carrier Family 25, (mitochondrial carrier), Member 18 (SLC25A18, Accession NM\_031481). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A18. SYNE-2 (Accession NM\_015180) is another VGAM804 host target gene. SYNE-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNE-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNE-2 BINDING SITE, designated SEQ ID:17533, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31224] Another function of VGAM804 is therefore inhibition of SYNE-2 (Accession NM\_015180). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNE-2. Triple Homeobox 1 (TIX1, Accession XM\_029734) is another VGAM804 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30932, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31225] Another function of VGAM804 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM\_029734). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with TIX1. LOC112868 (Accession XM\_053402) is another VGAM804 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36085, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31226] Another function of VGAM804 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC130951 (Accession NM\_138804) is another VGAM804 host target gene. LOC130951 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130951 BINDING SITE, designated SEQ ID:29028, to the nucleotide sequence of VGAM804 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3515.

[31227] Another function of VGAM804 is therefore inhibition of LOC130951 (Accession NM\_138804). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130951. LOC144512 (Accession XM\_096623) is another VGAM804 host target gene. LOC144512 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144512 BINDING SITE, designated SEQ ID:40429, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31228] Another function of VGAM804 is therefore inhibition of LOC144512 (Accession XM\_096623). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144512. LOC145773 (Accession XM\_085237) is another VGAM804 host target gene. LOC145773 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145773, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145773 BINDING SITE, designated SEQ ID:37982, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31229] Another function of VGAM804 is therefore inhibition of LOC145773 (Accession XM\_085237). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145773. LOC150848 (Accession XM\_097959) is another VGAM804 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41261, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31230] Another function of VGAM804 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150848. LOC157860 (Accession XM\_098832) is another VGAM804 host target gene. LOC157860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157860 BINDING SITE, designated SEQ ID:41863, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31231] Another function of VGAM804 is therefore inhibition of LOC157860 (Accession XM\_098832). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157860. LOC200609 (Accession XM\_117256) is another VGAM804 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43337, to

the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31232] Another function of VGAM804 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC219988 (Accession XM\_166223) is another VGAM804 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44044, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31233] Another function of VGAM804 is therefore inhibition of LOC219988 (Accession XM\_166223). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. LOC221399 (Accession XM\_168134) is another VGAM804 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45050, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31234] Another function of VGAM804 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. LOC253675 (Accession XM\_172990) is another VGAM804 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46267, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31235] Another function of VGAM804 is therefore inhibition of LOC253675 (Accession XM\_172990). Accordingly, utilities

of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC253805 (Accession XM\_172854) is another VGAM804 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46137, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31236] Another function of VGAM804 is therefore inhibition of LOC253805 (Accession XM\_172854). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC254042 (Accession XM\_171022) is another VGAM804 host target gene. LOC254042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254042 BINDING SITE, designated SEQ ID:45793, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31237] Another function of VGAM804 is therefore inhibition of LOC254042 (Accession XM\_171022). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254042. LOC254143 (Accession XM\_172880) is another VGAM804 host target gene. LOC254143 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254143 BINDING SITE, designated SEQ ID:46158, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31238] Another function of VGAM804 is therefore inhibition of LOC254143 (Accession XM\_172880). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254143. LOC256942 (Accession XM\_170544) is another VGAM804 host target gene. LOC256942 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256942 BINDING SITE, designated SEQ ID:45364, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31239] Another function of VGAM804 is therefore inhibition of LOC256942 (Accession XM\_170544). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256942. LOC57109 (Accession NM\_020385) is another VGAM804 host target gene. LOC57109 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57109 BINDING SITE, designated SEQ ID:21657, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31240] Another function of VGAM804 is therefore inhibition of

LOC57109 (Accession NM\_020385). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57109. LOC91263 (Accession XM\_037264) is another VGAM804 host target gene. LOC91263 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:32597, to the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, also designated SEQ ID:3515.

[31241] Another function of VGAM804 is therefore inhibition of LOC91263 (Accession XM\_037264). Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 805 (VGAM805) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[31242] VGAM805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM805 was detected is described hereinabove with reference to Figs. 1–8.

[31243] VGAM805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline Immunodeficiency Virus. VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31244] VGAM805 gene encodes a VGAM805 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM805 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM805 precursor RNA is designated SEQ ID:791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:791 is located at position 8793 relative to the genome of Feline Immunodeficiency Virus.

[31245] VGAM805 precursor RNA folds onto itself, forming VGAM805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[31246] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM805 folded precursor RNA into VGAM805 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 48%) nucleotide se-  
quence of VGAM805 RNA is designated SEQ ID:3516, and  
is provided hereinbelow with reference to the sequence  
listing part.

[31247] VGAM805 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM805 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM805 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31248] VGAM805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM805 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[31249] The complementary binding of VGAM805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM805 host target RNA into VGAM805 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31250] It is appreciated that VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM805 host target genes. The mRNA of each one of this plurality of VGAM805 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM805 RNA, herein designated VGAM RNA, and which when bound by VGAM805 RNA causes inhibition of translation of respective one or more VGAM805 host target proteins.

[31251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM805 gene, herein designated VGAM GENE, on one or

more VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31252] It is yet further appreciated that a function of VGAM805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of viral infection by Feline Immunodeficiency Virus. Specific functions, and accordingly utilities, of VGAM805 correlate with, and may be deduced from, the identity of the host target genes which VGAM805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [31253] Nucleotide sequences of the VGAM805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM805 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM805 are further described hereinbelow with reference to Table 1.
- [31254] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM805 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM805 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [31255] As mentioned hereinabove with reference to Fig. 1, a function of VGAM805 gene, herein designated VGAM is inhibition of expression of VGAM805 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM805 correlate with, and may be deduced from, the identity of the target genes which VGAM805 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [31256] BCL2-like 2 (BCL2L2, Accession NM\_004050) is a

VGAM805 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10265, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31257] A function of VGAM805 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM\_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431. Integrin, Alpha 1 (ITGA1, Accession XM\_032902) is another VGAM805 host target gene. ITGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of ITGA1 BINDING SITE, designated SEQ ID:31789, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31258] Another function of VGAM805 is therefore inhibition of Integrin, Alpha 1 (ITGA1, Accession XM\_032902). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA1. Angiomotin Like 1 (AMOTL1, Accession XM\_057045) is another VGAM805 host target gene. AMOTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL1 BINDING SITE, designated SEQ ID:36466, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31259] Another function of VGAM805 is therefore inhibition of Angiomotin Like 1 (AMOTL1, Accession XM\_057045). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with AMOTL1. Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM\_049398) is another VGAM805 host target gene. C20orf98 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf98 BINDING SITE, designated SEQ ID:35418, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31260] Another function of VGAM805 is therefore inhibition of Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM\_049398). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98. DKFZP762D096 (Accession XM\_037662) is another VGAM805 host target gene. DKFZP762D096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP762D096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZP762D096 BINDING SITE, designated SEQ ID:32667, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31261] Another function of VGAM805 is therefore inhibition of DKFZP762D096 (Accession XM\_037662). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762D096. Docking Protein 4 (DOK4, Accession NM\_018110) is another VGAM805 host target gene. DOK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:19882, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31262] Another function of VGAM805 is therefore inhibition of Docking Protein 4 (DOK4, Accession NM\_018110). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4. FLJ10043 (Accession NM\_017979) is another VGAM805 host target gene. FLJ10043 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10043 BINDING SITE, designated SEQ ID:19707, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31263] Another function of VGAM805 is therefore inhibition of FLJ10043 (Accession NM\_017979). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10043. FLJ14743 (Accession XM\_042708) is another VGAM805 host target gene. FLJ14743 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14743 BINDING SITE, designated SEQ ID:33763, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31264] Another function of VGAM805 is therefore inhibition of

FLJ14743 (Accession XM\_042708). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14743. KIAA0889 (Accession NM\_015377) is another VGAM805 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17677, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31265] Another function of VGAM805 is therefore inhibition of KIAA0889 (Accession NM\_015377). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. MGC15476 (Accession NM\_145056) is another VGAM805 host target gene. MGC15476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC15476 BINDING SITE, designated SEQ ID:29688, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31266] Another function of VGAM805 is therefore inhibition of MGC15476 (Accession NM\_145056). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15476. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM\_003559) is another VGAM805 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9611, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31267] Another function of VGAM805 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM\_003559). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PIP5K2B. Retinoic Acid Induced 16 (RAI16, Accession NM\_022749) is another VGAM805 host target gene. RAI16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI16 BINDING SITE, designated SEQ ID:22970, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31268] Another function of VGAM805 is therefore inhibition of Retinoic Acid Induced 16 (RAI16, Accession NM\_022749). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI16. LOC115297 (Accession XM\_053313) is another VGAM805 host target gene. LOC115297 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115297 BINDING SITE, desig-

nated SEQ ID:36072, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31269] Another function of VGAM805 is therefore inhibition of LOC115297 (Accession XM\_053313). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC146988 (Accession XM\_097150) is another VGAM805 host target gene. LOC146988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146988 BINDING SITE, designated SEQ ID:40779, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31270] Another function of VGAM805 is therefore inhibition of LOC146988 (Accession XM\_097150). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146988. LOC254755 (Accession XM\_173224) is another VGAM805 host target gene. LOC254755 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254755 BINDING SITE, designated SEQ ID:46488, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31271] Another function of VGAM805 is therefore inhibition of LOC254755 (Accession XM\_173224). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254755. LOC51075 (Accession NM\_015959) is another VGAM805 host target gene. LOC51075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51075 BINDING SITE, designated SEQ ID:18069, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31272] Another function of VGAM805 is therefore inhibition of

LOC51075 (Accession NM\_015959). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51075. LOC90072 (Accession XM\_028702) is another VGAM805 host target gene. LOC90072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90072 BINDING SITE, designated SEQ ID:30728, to the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, also designated SEQ ID:3516.

[31273] Another function of VGAM805 is therefore inhibition of LOC90072 (Accession XM\_028702). Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90072. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 806 (VGAM806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[31274] VGAM806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM806 was detected is described hereinabove with reference to Figs. 1–8.

[31275] VGAM806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31276] VGAM806 gene encodes a VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM806 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM806 precursor RNA is designated SEQ ID:792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:792 is located at position 250093 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[31277] VGAM806 precursor RNA folds onto itself, forming VGAM806 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[31278] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM806 folded precursor RNA into VGAM806 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 80%) nucleotide se-  
quence of VGAM806 RNA is designated SEQ ID:3517, and  
is provided hereinbelow with reference to the sequence  
listing part.

[31279] VGAM806 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM806 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM806 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31280] VGAM806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM806 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM806 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31281] The complementary binding of VGAM806 RNA, herein designated VGAM RNA, to host target binding sites on VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM806 host target RNA into VGAM806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31282] It is appreciated that VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM806 host target genes. The mRNA of each one of this plurality of VGAM806 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM806 RNA, herein designated VGAM RNA, and which when bound by VGAM806 RNA causes inhibition of translation of respective one or more VGAM806 host target proteins.

[31283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM806 gene, herein designated VGAM GENE, on one or more VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31284] It is yet further appreciated that a function of VGAM806 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM806 correlate with, and may be deduced from, the identity of the host target genes which VGAM806 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[31285] Nucleotide sequences of the VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM806 are further described hereinbelow with reference to Table 1.

[31286] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM806 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31287] As mentioned hereinabove with reference to Fig. 1, a function of VGAM806 gene, herein designated VGAM is inhibition of expression of VGAM806 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM806 correlate with, and may be deduced from, the identity of the target genes which VGAM806 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[31288] Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM\_005160) is a VGAM806 host target gene. ADRBK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRBK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRBK2 BINDING SITE, designated SEQ ID:11643, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31289] A function of VGAM806 is therefore inhibition of Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM\_005160), a gene which regulates desensitization of G protein-coupled receptors. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRBK2. The function of ADRBK2 has been established by previous studies. In the rat and the mouse, Benovic et al. (1991) identified a second beta-adrenergic receptor kinase. See beta-adrenergic receptor kinase-1 (ADRBK1; 109635). They isolated the receptor by screening a bovine brain

cDNA library with a catalytic domain fragment of the beta-adrenergic receptor kinase. The enzyme, which they termed BARK2, showed overall amino acid identity of 85% with BARK1, with the protein kinase catalytic domain having 95% identity. In the rat, BARK2 mRNA was localized predominantly in neuronal tissues, although low levels were also observed in various tissues. The gene encoding BARK2 mapped to mouse chromosome 5, whereas that encoding BARK1 was localized to mouse chromosome 19. This may indicate that the ADRBK2 gene is located on human chromosome 4 or chromosome 7 since these show extensive homology of synteny with mouse chromosome 5. In fact, however, Calabrese et al. (1994) demonstrated by fluorescence in situ hybridization that the ADRBK2 gene is located on human 22q11.

[31290] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31291] Benovic, J. L.; Onorato, J. J.; Arriza, J. L.; Stone, W. C.; Lohse, M.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Caron, M. G.; Lefkowitz, R. J. : Cloning, expression, and chromosomal localization of beta-adrenergic receptor kinase 2: a new member of the receptor kinase family. J.

Biol. Chem. 266: 14939–14946, 1991. ; and

[31292] Calabrese, G.; Sallese, M.; Stornaiuolo, A.; Stuppia, L.; Palka, G.; De Blasi, A. : Chromosome mapping of the human arrestin (SAG), beta-arrestin 2 (ARRB2), and beta-adrenergic receptor.

[31293] Further studies establishing the function and utilities of ADRBK2 are found in John Hopkins OMIM database record ID 109636, and in cited publications numbered 145 and 5931 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455) is another VGAM806 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10754, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31294] Another function of VGAM806 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455), a gene which probably contribute to the

synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 has been established by previous studies. The tumor suppressors EXT1 (OMIM Ref. No. 133700) and EXT2 (OMIM Ref. No. 133701) are associated with hereditary multiple exostoses and encode bifunctional glycosyltransferases essential for chain polymerization of heparan sulfate and its analog, heparin. Wise et al. (1997) identified another gene, termed EXTL by them, that showed striking sequence similarity to both EXT1 and EXT2 at the nucleotide and amino acid sequence levels. Although the mRNA transcribed from this gene is similar in size to that of EXT1 and EXT2, its pattern of expression was quite different. Of the 3 highly homologous EXT-like genes, EXTL1, EXTL2 (OMIM Ref. No. 602411), and EXTL3 (OMIM Ref. No. 605744), EXTL2 is an alpha-1,4-GlcNAc transferase I, the key enzyme that initiates the heparan sulfate/heparin synthesis. Kim et al. (2001) transiently expressed truncated forms of EXTL1 and EXTL3, lacking the putative NH<sub>2</sub>-terminal transmembrane and cytoplasmic domains, in COS-1 cells and found that the cells harbored alpha-GlcNAc transferase activity. Various

results suggested that EXTL3 is most likely involved in both chain initiation and elongation, whereas EXTL1 is possibly involved only in the chain elongation of heparan sulfate, and perhaps of heparin as well. Thus, the acceptor specificities of the 5 family members are overlapping but distinct, except for EXT1 and EXT2, which have the same specificity. Thus, all of the 5 cloned human EXT gene family proteins harbor glycosyltransferase activities, which probably contribute to the synthesis of heparan sulfate and heparin. Xu et al. (1999) examined the EXTL1 and EXTL2 genes for the presence of germline mutations in hereditary multiple exostosis patients and found none. Hall et al. (2002) proposed the EXTL genes as candidates for second mutations leading to the development of exostoses. By radiation hybrid analysis and by fluorescence in situ hybridization, Wise et al. (1997) mapped EXTL to 1p36.1 between D1S458 and D1S511, a region that frequently shows loss of heterozygosity in a variety of tumor types.

[31295] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31296] Wise, C. A.; Clines, G. A.; Massa, H.; Trask, B. J.; Lovett, M.

: Identification and localization of the gene for EXTL, a third member of the multiple exostoses gene family.

Genome Res. 7: 10–16, 1997. ; and

[31297] Kim, B.-T.; Kitagawa, H.; Tamura, J.; Saito, T.; Kusche-Gullberg, M.; Lindahl, U.; Sugahara, K. : Human tumor suppressor EXT gene family members EXTL1 and EXTL3 encode alpha-1,4-N-acetyl.

[31298] Further studies establishing the function and utilities of EXTL1 are found in John Hopkins OMIM database record ID 601738, and in cited publications numbered 3588, 9324–932 and 11784 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein-coupled Receptor 65 (GPR65, Accession XM\_007392) is another VGAM806 host target gene. GPR65 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR65 BINDING SITE, designated SEQ ID:30052, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31299] Another function of VGAM806 is therefore inhibition of G Protein-coupled Receptor 65 (GPR65, Accession XM\_007392). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR65. Podocalyxin-like (PODXL, Accession NM\_005397) is another VGAM806 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11869, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31300] Another function of VGAM806 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM\_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM247.TSLP (Accession NM\_033035) is another VGAM806 host target gene. TSLP BINDING SITE1 and TSLP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TSLP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSLP BINDING SITE1 and TSLP BINDING SITE2, designated SEQ ID:26928 and SEQ ID:28848 respectively, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31301] Another function of VGAM806 is therefore inhibition of TSLP (Accession NM\_033035), a gene which may contribute directly to the activation of Langerhans cells and inhibit apoptosis. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSLP. The function of TSLP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558.Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331) is another VGAM806 host target gene. C20orf121 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23628, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31302] Another function of VGAM806 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. Chromosome 8 Open Reading Frame 14 (C8orf14, Accession NM\_054029) is another VGAM806 host target gene. C8orf14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C8orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf14 BINDING SITE, designated SEQ ID:27639, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ

ID:3517.

[31303] Another function of VGAM806 is therefore inhibition of Chromosome 8 Open Reading Frame 14 (C8orf14, Accession NM\_054029). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf14. FLJ11274 (Accession NM\_018375) is another VGAM806 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:20399, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31304] Another function of VGAM806 is therefore inhibition of FLJ11274 (Accession NM\_018375). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. FLJ21657 (Accession NM\_022483) is another VGAM806 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:22857, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31305] Another function of VGAM806 is therefore inhibition of FLJ21657 (Accession NM\_022483). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. FLJ32334 (Accession NM\_144565) is another VGAM806 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29368, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31306] Another function of VGAM806 is therefore inhibition of FLJ32334 (Accession NM\_144565). Accordingly, utilities of

VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. Protein-kinase, Interferon-inducible Double Stranded RNA Dependent Inhibitor, Repressor of (P58 repressor) (PRKRIR, Accession NM\_004705) is another VGAM806 host target gene. PRKRIR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKRIR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKRIR BINDING SITE, designated SEQ ID:11051, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31307] Another function of VGAM806 is therefore inhibition of Protein-kinase, Interferon-inducible Double Stranded RNA Dependent Inhibitor, Repressor of (P58 repressor) (PRKRIR, Accession NM\_004705). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKRIR. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832) is another VGAM806 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27414, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31308] Another function of VGAM806 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. UBX Domain Containing 2 (UBXD2, Accession XM\_043196) is another VGAM806 host target gene. UBXD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBXD2 BINDING SITE, designated SEQ ID:33911, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31309] Another function of VGAM806 is therefore inhibition of UBX Domain Containing 2 (UBXD2, Accession XM\_043196). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBXD2. LOC144473 (Accession XM\_096606) is another VGAM806 host target gene. LOC144473 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144473 BINDING SITE, designated SEQ ID:40413, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31310] Another function of VGAM806 is therefore inhibition of LOC144473 (Accession XM\_096606). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144473. LOC152345 (Accession XM\_087442) is another VGAM806 host target gene. LOC152345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152345, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152345 BINDING SITE, designated SEQ ID:39265, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31311] Another function of VGAM806 is therefore inhibition of LOC152345 (Accession XM\_087442). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152345. LOC222678 (Accession XM\_167111) is another VGAM806 host target gene. LOC222678 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222678 BINDING SITE, designated SEQ ID:44605, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31312] Another function of VGAM806 is therefore inhibition of LOC222678 (Accession XM\_167111). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC222678. LOC91796 (Accession XM\_040743) is another VGAM806 host target gene. LOC91796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91796 BINDING SITE, designated SEQ ID:33372, to the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, also designated SEQ ID:3517.

[31313] Another function of VGAM806 is therefore inhibition of LOC91796 (Accession XM\_040743). Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 807 (VGAM807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31314] VGAM807 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM807 was detected is described hereinabove with reference to Figs. 1–8.

[31315] VGAM807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31316] VGAM807 gene encodes a VGAM807 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM807 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM807 precursor RNA is designated SEQ ID:793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:793 is located at position 61419 relative to the genome of Equine Herpesvirus 2.

[31317] VGAM807 precursor RNA folds onto itself, forming VGAM807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31318] An enzyme complex designated DICER COMPLEX, `dices` the VGAM807 folded precursor RNA into VGAM807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM807 RNA is designated SEQ ID:3518, and is provided hereinbelow with reference to the sequence listing part.

[31319] VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM807 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31320] VGAM807 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM807 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM807 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31321] The complementary binding of VGAM807 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM807 host target RNA into VGAM807 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31322] It is appreciated that VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM807 host target genes. The mRNA of each one of this plurality of VGAM807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM807 RNA, herein designated VGAM RNA, and which when bound by VGAM807 RNA causes inhibition of translation of respective one or more VGAM807 host target proteins.

[31323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM807 gene, herein designated VGAM GENE, on one or more VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31324] It is yet further appreciated that a function of VGAM807 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM807 correlate with, and may be deduced from, the identity of the host target genes which VGAM807 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31325] Nucleotide sequences of the VGAM807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM807 are further described hereinbelow with reference to Table 1.

[31326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM807 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31327] As mentioned hereinabove with reference to Fig. 1, a function of VGAM807 gene, herein designated VGAM is inhibition of expression of VGAM807 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM807 correlate with, and may be deduced from, the identity of the target genes which VGAM807 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31328] Adenylate Cyclase 7 (ADCY7, Accession NM\_001114) is a VGAM807 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6781, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31329] A function of VGAM807 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM\_001114), a gene which is a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108. Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184) is another VGAM807 host target gene. CALM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of CALM3 BINDING SITE, designated SEQ ID:11685, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31330] Another function of VGAM807 is therefore inhibition of Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184), a gene which mediates the control of a large number of enzymes by  $Ca^{++}$ . Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM3. The function of CALM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM785. Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936) is another VGAM807 host target gene. CDK5R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK5R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5R2 BINDING SITE, designated SEQ ID:10041, to the nucleotide sequence of VGAM807 RNA,

herein designated VGAM RNA, also designated SEQ ID:3518.

[31331] Another function of VGAM807 is therefore inhibition of Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936), a gene which acts as a regulatory subunit for the cyclin-dependent CDK5. Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5R2. The function of CDK5R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM403. Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373) is another VGAM807 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8182, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31332] Another function of VGAM807 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM807 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10476, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31333] Another function of VGAM807 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3,

Accession NM\_004273). Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. FLJ10350 (Accession XM\_170946) is another VGAM807 host target gene. FLJ10350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10350 BINDING SITE, designated SEQ ID:45729, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31334] Another function of VGAM807 is therefore inhibition of FLJ10350 (Accession XM\_170946). Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10350. Transducin (beta)-like 1Y-linked (TBL1Y, Accession NM\_033284) is another VGAM807 host target gene. TBL1Y BINDING SITE1 through TBL1Y BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TBL1Y, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1Y BINDING SITE1 through TBL1Y BINDING SITE3, designated SEQ ID:27099, SEQ ID:28609 and SEQ ID:28610 respectively, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31335] Another function of VGAM807 is therefore inhibition of Transducin (beta)-like 1Y-linked (TBL1Y, Accession NM\_033284). Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1Y. LOC125268 (Accession XM\_071960) is another VGAM807 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:37449, to the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, also designated SEQ ID:3518.

[31336] Another function of VGAM807 is therefore inhibition of LOC125268 (Accession XM\_071960). Accordingly, utilities

of VGAM807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 808 (VGAM808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31337] VGAM808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM808 was detected is described hereinabove with reference to Figs. 1–8.

[31338] VGAM808 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31339] VGAM808 gene encodes a VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM808 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM808 precursor RNA is designated SEQ ID:794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:794 is located at position 60546 relative to the genome of Equine Herpesvirus 2.

[31340] VGAM808 precursor RNA folds onto itself, forming VGAM808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31341] An enzyme complex designated DICER COMPLEX, `dices` the VGAM808 folded precursor RNA into VGAM808 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM808 RNA is designated SEQ ID:3519, and

is provided hereinbelow with reference to the sequence listing part.

[31342] VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM808 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31343] VGAM808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM808 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM808 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31344] The complementary binding of VGAM808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM808 host target RNA into VGAM808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31345] It is appreciated that VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM808 host target genes. The mRNA of each one of this plurality of VGAM808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM808 RNA, herein designated VGAM RNA, and which when bound by VGAM808 RNA causes inhibition of translation of respective one or more VGAM808 host target proteins.

[31346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM808 gene, herein designated VGAM GENE, on one or more VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31347] It is yet further appreciated that a function of VGAM808 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM808 correlate with, and may be deduced from, the identity of the host target genes which VGAM808 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31348] Nucleotide sequences of the VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM808 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM808 are further described hereinbelow with reference to Table 1.

[31349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM808 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31350] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM808 gene, herein designated VGAM is inhibition of expression of VGAM808 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM808 correlate with, and may be deduced from, the identity of the target genes which VGAM808 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31351] Absent In Melanoma 1 (AIM1, Accession XM\_166300) is a VGAM808 host target gene. AIM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:44114, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31352] A function of VGAM808 is therefore inhibition of Absent In Melanoma 1 (AIM1, Accession XM\_166300), a gene which interactions with the cytoskeleton. Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIM1. The function of AIM1 has been established by previous stud-

ies. The AIM1 gene encodes a melanocyte differentiation antigen that is expressed in a high percentage of melanoma cell lines. Its homolog in medaka, 'B,' encodes a transporter that mediates melanin synthesis. Harada et al. (2001) identified an antigen in human melanoma that they called AIM1 protein. The AIM1 gene was expressed in 3 melanoma cell lines, but not in a fibroblast cell line, and not at significant levels in any of 15 normal tissues. The human AIM1 gene encodes a protein of 530 amino acids. Northern blot analysis detected 2 transcripts, one of 1.7 kb and the other of 2.8 kb. Harada et al. (2001) concluded that the AIM1 gene encodes a melanocyte differentiation antigen that is expressed in a high percentage of melanoma cell lines. By sequence analysis, Newton et al. (2001) mapped the MATP gene to chromosome 5p.

[31353] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31354] Harada, M.; Li, Y. F.; El-Gamil, M.; Rosenberg, S. A.; Robbins, P. F. : Use of an in vitro immunoselected tumor line to identify shared melanoma antigens recognized by HLA-A\*0201-restricted T cells. Cancer Res. 61: 1089-1094, 2001. ; and

[31355] Newton, J. M.; Cohen-Barak, O.; Hagiwara, N.; Gardner, J. M.; Davisson, M. T.; King, R. A.; Brilliant, M. H. : Mutations in the human orthologue of the mouse underwhite gene (uw) underl.

[31356] Further studies establishing the function and utilities of AIM1 are found in John Hopkins OMIM database record ID 606202, and in cited publications numbered 904–906 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EphB4 (EPHB4, Accession NM\_004444) is another VGAM808 host target gene. EPHB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB4 BINDING SITE, designated SEQ ID:10738, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31357] Another function of VGAM808 is therefore inhibition of EphB4 (EPHB4, Accession NM\_004444), a gene which receptor for members of the ephrin-b family. binds to ephrin-b2. Accordingly, utilities of VGAM808 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with EPHB4. The function of EPHB4 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. In CD34+ human bone marrow cells and a human hepatocellular carcinoma cell line, Bennett et al. (1994) identified a novel transmembrane tyrosine kinase, which they called hepatoma transmembrane kinase, or HTK. They reported that the predicted 987-amino acid sequence of HTK includes a transmembrane region and signal sequence. The predicted extracellular domain contains a cysteine-rich region and tandem fibronectin type III repeats, while the intracellular domain contains the catalytic domain. Northern blot analysis demonstrated a single HTK transcript abundantly expressed in placenta and in a range of primary tissues and malignant cell lines. It is expressed in fetal, but not adult, brain, and in primitive and myeloid, but not lymphoid, hematopoietic cells. The protein shared amino acid similarity with the Eph subfamily of tyrosine kinases. Using 2 independent sets of primers specific for human HTK to amplify DNA from a panel of human-hamster hybrid cell lines, they demonstrated that the human gene is located on chromosome 7. Berclaz et

al. (1996) examined the expression of HTK in normal and malignant breast tissue. They found that in normal breast, expression is confined to secretory luminal epithelial cells. They found elevated expression of HTK in several human breast carcinoma cell lines as well as in primary ductal carcinomas of the breast. The authors suggested that HTK may have a role in the differentiation or maintenance of secretory epithelia. Gerety et al. (1999) generated mice with a targeted disruption of EphB4 by introducing a tau-lacZ marker into the gene. Unlike the broadly expressed ephrin B2 gene (EFNB2; 600527), EphB4 is uniquely expressed in vascular endothelial and endocardial cells. The authors' analysis also confirmed that EphB4 is preferentially expressed on veins. Remarkably, the phenotype of homozygous EphB4 mutants was virtually symmetric to that of EfnB2 mutants. These data identified EphB4 as the major essential interaction partner of EFNB2 in angiogenesis and further indicated that the requisite function of this receptor is intrinsic to the circulatory system. In addition, these data indicated that EFNB2 and EphB4 mediate reciprocal interactions between arteries and veins that are essential for proper angiogenic remodeling of the capillary beds.

[31358] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31359] Bennett, B. D.; Wang, Z.; Kuang, W.-J.; Wang, A.; Groopman, J. E.; Goeddel, D. V.; Scadden, D. T. : Cloning and characterization of HTK, a novel transmembrane tyrosine kinase of the EPH subfamily. J. Biol. Chem. 269: 14211–14218, 1994. ; and

[31360] Gerety, S. S.; Wang, H. U.; Chen, Z.-F.; Anderson, D. J. : Symmetrical mutant phenotypes of the receptor EphB4 and its specific transmembrane ligand ephrin-B2 in cardiovascular developme.

[31361] Further studies establishing the function and utilities of EPHB4 are found in John Hopkins OMIM database record ID 600011, and in cited publications numbered 8346–8348 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box A3 (HOXA3, Accession NM\_030661) is another VGAM808 host target gene. HOXA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of HOXA3 BINDING SITE, designated SEQ ID:24993, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31362] Another function of VGAM808 is therefore inhibition of Homeo Box A3 (HOXA3, Accession NM\_030661). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA3. Tenascin C (hexabrachion) (TNC, Accession NM\_002160) is another VGAM808 host target gene. TNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNC BINDING SITE, designated SEQ ID:7935, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31363] Another function of VGAM808 is therefore inhibition of Tenascin C (hexabrachion) (TNC, Accession NM\_002160), a gene which has epidermal growth factor-like repeats. Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TNC. The function of TNC has been established by previous studies. Tenascin, also known as hexabrachion and cytotactin, is an extracellular matrix protein with a spatially and temporally restricted tissue distribution. It is a hexomeric, multidomain protein with disulfide-linked subunits of 190 to 240 kD, originally characterized as 'myotendinous antigen.' In the embryo it is present in dense mesenchyme surrounding developing epithelia, in tendon anlagen, and in developing cartilage and bone. In the adult tenascin remains present in tendons and myotendinous junctions in the perichondrium and periosteum, as well as in smooth muscle. Pearson et al. (1988) isolated cDNA clones coding for tenascin from a chicken fibroblast cDNA expression library using a specific tenascin antiserum. They showed induction of tenascin in vitro by fetal calf serum as well as by transforming growth factor-beta (OMIM Ref. No. 190180). The gene is also called hexabrachion (HXB). Olson and Srivastava (1996) reviewed processes involved in separation of the cardiac tube into the atria, ventricles, and outflow tract. They noted that tenascin is upregulated and NCAM (OMIM Ref. No. 116930) is downregulated in the embryonic endocardial cushions. This upregulation of tenascin

is thought to disrupt cell substrate adhesion and to allow cells to migrate through the extracellular component of the cardiac cushion. Olson and Srivastava (1996) suggested that abnormalities or arrests in these processes may be responsible for some of the AV canal and conotruncal defects in infants. Animal model experiments lend further support to the function of TNC. In the central nervous system, tenascin C is expressed primarily by astrocytes. Tenascin is precisely localized in the vibrissae-related barrel fields of the developing somatosensory cortex, suggesting that it may be important in the formation of barrel boundaries. Steindler et al. (1995) demonstrated normal barrels in homozygous knockout mice for tenascin C, finding no abnormalities of the barrel boundaries despite the absence of this molecule. However, Mitrovic and Schachner (1995) were able to detect tenascin C immunoreactivity, albeit in an abnormal pattern, in the knockout mice designed to be null mutants for tenascin C expression.

[31364] It is appreciated that the abovementioned animal model for TNC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[31365] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31366] Olson, E.; Srivastava, D. : Molecular pathways controlling heart development. Science 272: 671–676, 1996. ; and

[31367] Steindler, D. A.; Settles, D.; Erickson, H. P.; Laywell, E. D.; Yoshiki, A.; Faissner, A.; Kusakabe, M. : Tenascin knock-out mice: barrels, boundary molecules, and glial scars. J. Neurosc.

[31368] Further studies establishing the function and utilities of TNC are found in John Hopkins OMIM database record ID 187380, and in cited publications numbered 12678–12682, 12341–59 and 10840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434G1415 (Accession NM\_031292) is another VGAM808 host target gene. DKFZP434G1415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1415 BINDING SITE, designated SEQ ID:25315, to the nucleotide sequence of

VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31369] Another function of VGAM808 is therefore inhibition of DKFZP434G1415 (Accession NM\_031292). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1415. FLJ10508 (Accession NM\_018118) is another VGAM808 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:19894, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31370] Another function of VGAM808 is therefore inhibition of FLJ10508 (Accession NM\_018118). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ14708 (Accession NM\_032827) is another VGAM808 host target gene. FLJ14708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ14708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14708 BINDING SITE, designated SEQ ID:26600, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31371] Another function of VGAM808 is therefore inhibition of FLJ14708 (Accession NM\_032827). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14708. KIAA0930 (Accession XM\_047214) is another VGAM808 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34917, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31372] Another function of VGAM808 is therefore inhibition of KIAA0930 (Accession XM\_047214). Accordingly, utilities

of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. KIAA1655 (Accession XM\_039442) is another VGAM808 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33085, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31373] Another function of VGAM808 is therefore inhibition of KIAA1655 (Accession XM\_039442). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1924 (Accession XM\_057091) is another VGAM808 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1924 BINDING SITE, designated SEQ ID:36478, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31374] Another function of VGAM808 is therefore inhibition of KIAA1924 (Accession XM\_057091). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM\_006726) is another VGAM808 host target gene. LRBA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRBA BINDING SITE, designated SEQ ID:13556, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31375] Another function of VGAM808 is therefore inhibition of LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM\_006726). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with LRBA. MGC9753 (Accession NM\_033419) is another VGAM808 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27240, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31376] Another function of VGAM808 is therefore inhibition of MGC9753 (Accession NM\_033419). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4C (SEMA4C, Accession NM\_017789) is another VGAM808 host target gene. SEMA4C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEMA4C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SEMA4C BINDING SITE, designated SEQ ID:19421, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31377] Another function of VGAM808 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4C (SEMA4C, Accession NM\_017789). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4C. LOC255631 (Accession XM\_171267) is another VGAM808 host target gene.

LOC255631 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255631 BINDING SITE, designated SEQ ID:46038, to the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, also designated SEQ ID:3519.

[31378] Another function of VGAM808 is therefore inhibition of LOC255631 (Accession XM\_171267). Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC255631. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 809 (VGAM809) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31379] VGAM809 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM809 was detected is described hereinabove with reference to Figs. 1–8.

[31380] VGAM809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31381] VGAM809 gene encodes a VGAM809 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM809 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM809 precursor RNA is designated SEQ

ID:795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:795 is located at position 60052 relative to the genome of Equine Herpesvirus 2.

[31382] VGAM809 precursor RNA folds onto itself, forming VGAM809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31383] An enzyme complex designated DICER COMPLEX, `dices` the VGAM809 folded precursor RNA into VGAM809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM809 RNA is designated SEQ ID:3520, and is provided hereinbelow with reference to the sequence

listing part.

[31384] VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM809 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31385] VGAM809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM809 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM809 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31386] The complementary binding of VGAM809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM809 host target RNA into VGAM809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31387] It is appreciated that VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM809 host target genes. The mRNA of each one of this plurality of VGAM809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM809 RNA, herein designated VGAM

RNA, and which when bound by VGAM809 RNA causes inhibition of translation of respective one or more VGAM809 host target proteins.

[31388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM809 gene, herein designated VGAM GENE, on one or more VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31389] It is yet further appreciated that a function of VGAM809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM809 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM809 correlate with, and may be deduced from, the identity of the host target genes which VGAM809 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31390] Nucleotide sequences of the VGAM809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM809 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM809 are further described hereinbelow with reference to Table 1.

[31391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM809 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31392] As mentioned hereinabove with reference to Fig. 1, a function of VGAM809 gene, herein designated VGAM is

inhibition of expression of VGAM809 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM809 correlate with, and may be deduced from, the identity of the target genes which VGAM809 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31393] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM\_005099) is a VGAM809 host target gene. ADAMTS4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADAMTS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE, designated SEQ ID:11566, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31394] A function of VGAM809 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM\_005099), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Ac-

cordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4. The function of ADAMTS4 has been established by previous studies. Aggrecan degradation is an important factor in the erosion of articular cartilage in arthritic diseases. This degradation involves proteolysis of the aggrecan core protein near the N terminus, where 2 major cleavage sites have been identified. Matrix metalloproteinases (MMPs) cleave aggrecan between asn341 and phe342. Aggrecanase cleaves aggrecan between glu373 and ala374. Tortorella et al. (1999) purified and partially sequenced bovine aggrecanase-1. By PCR with primers designed from a highly homologous murine EST, they cloned sequences from the homologous human cDNA. They assembled a full-length open reading frame from this initial human PCR product and from another human EST. The human aggrecanase-1 (ADAMTS4) open reading frame encodes an 837-amino acid protein with a signal sequence, a propeptide domain, a catalytic domain, a disintegrin-like domain, and a C-terminal domain with a thrombospondin (TSP) type 1 motif. There is a conserved zinc-binding domain and a furin-sensitive sequence. The presence of a probable cysteine switch sequence in ag-

aggrecanase-1 suggested that, like the MMPs, it is synthesized as a zymogen and is cleaved to remove the propeptide domain and generate the mature active enzyme. A cloned portion of the bovine aggrecanase-1 cDNA was 94% homologous to the human cDNA. Human aggre-canase-1 cleaved bovine aggrecan between the glu373-ala374, but not the asn341-phe342, bond. Tortorella et al. (1999) stated that ADAMTS4 mRNA is present in brain, lung, and heart, and at very low levels in placenta and muscle tissues. By RT-PCR, Tortorella et al. (1999) observed upregulation of the aggrecanase-1 message in stimulated human fetal chondrocytes and in joint tissues from adjuvant arthritic rats. Using a GeneBridge 4 radiation hybrid panel, Ishikawa et al. (1998) mapped the ADAMTS4 gene to chromosome 1. Hurskainen et al. (1999) mapped the human ADAMTS4 gene to chromosome 1 by somatic cell hybrid analysis. They mapped the mouse Adamts4 gene to chromosome 1.

[31395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31396] Tortorella, M. D.; Burn, T. C.; Pratta, M. A.; Abbaszade, I.; Hollis, J. M.; Liu, R.; Rosenfeld, S. A.; Copeland, R. A.; De-

cicco, C. P.; Wynn, R.; Rockwell, A.; Yang, F.; and 16 others : Purification and cloning of aggrecanase-1: a member of the ADAMTS family of proteins. Science 284: 1664-1666, 1999. ; and

[31397] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM-TS5, ADAM-TS6, and ADAM-TS7, novel members of a new family of zinc metalloproteases: general features and genomic dist.

[31398] Further studies establishing the function and utilities of ADAMTS4 are found in John Hopkins OMIM database record ID 603876, and in cited publications numbered 760 and 8473-7606 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774) is another VGAM809 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30283, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31399] Another function of VGAM809 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM\_003926) is another VGAM809 host target gene. MBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD3 BINDING SITE, designated SEQ ID:10021, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31400] Another function of VGAM809 is therefore inhibition of Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM\_003926), a gene which are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex. Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD3. The function of MBD3 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM247. Spleen Focus Forming Virus (SFFV) Proviral Integration Oncogene Spi1 (SPI1, Accession NM\_003120) is another VGAM809 host target gene. SPI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPI1 BINDING SITE, designated SEQ ID:9091, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31401] Another function of VGAM809 is therefore inhibition of Spleen Focus Forming Virus (SFFV) Proviral Integration Oncogene Spi1 (SPI1, Accession NM\_003120), a gene which act as a lymphoid-specific enhancer. Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPI1. The function of SPI1 has been established by previous studies. DeKoter and Singh (2000) used retroviral transduction of PU.1 cDNA into mutant hematopoietic progenitors to demonstrate that differing concentrations of the protein regulate the development of B lymphocytes

as compared with macrophages. A low concentration of PU.1 protein induces the B cell fate, whereas a high concentration promotes macrophage differentiation and blocks B cell development. Conversely, a transcriptionally weakened mutant protein preferentially induces B cell generation. DeKoter and Singh (2000) concluded that graded expression of a transcription factor can be used to specify distinct cell fates in the hematopoietic system. DeKoter et al. (2002) showed that hemopoietic progenitor cells lacking PU.1 failed to express interleukin-7 receptor-alpha (IL7R; 146661) transcripts. Promoter and crosslinking analyses suggested that PU.1 directly regulates IL7R transcription. Expression of IL7R in PU.1 -/- progenitors restored IL7 (OMIM Ref. No. 146660)-dependent proliferation and induced, at low frequency, the generation of pro-B cells that underwent an apparently normal differentiation program. SPIB (OMIM Ref. No. 606802) could substitute for PU.1 early in B-cell development, but it was not required. DeKoter et al. (2002) concluded that PU.1 partially controls early B-cell development by regulating the expression of IL7R.

[31402] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[31403] DeKoter, R. P.; Singh, H. : Regulation of B lymphocyte and macrophage development by graded expression of PU.1. Science 288: 1439–1441, 2000. ; and

[31404] DeKoter, R. P.; Lee, H.-J.; Singh, H. : PU.1 regulates expression of the interleukin–7 receptor in lymphoid progenitors. Immunity 16: 297–309, 2002.

[31405] Further studies establishing the function and utilities of SPI1 are found in John Hopkins OMIM database record ID 165170, and in cited publications numbered 5127–513 and 2385 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13841 (Accession NM\_024702) is another VGAM809 host target gene. FLJ13841 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13841 BINDING SITE, designated SEQ ID:24016, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31406] Another function of VGAM809 is therefore inhibition of

FLJ13841 (Accession NM\_024702). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13841. FLJ20200 (Accession NM\_017708) is another VGAM809 host target gene. FLJ20200 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20200 BINDING SITE, designated SEQ ID:19287, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31407] Another function of VGAM809 is therefore inhibition of FLJ20200 (Accession NM\_017708). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20200. GMPPB (Accession NM\_021971) is another VGAM809 host target gene. GMPPB BINDING SITE1 and GMPPB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GMPPB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of GMPPB BINDING SITE1 and GMPPB BINDING SITE2, designated SEQ ID:22499 and SEQ ID:14981 respectively, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31408] Another function of VGAM809 is therefore inhibition of GMPPB (Accession NM\_021971). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607) is another VGAM809 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23859, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31409] Another function of VGAM809 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607). Accordingly, utilities of

VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. RBT1 (Accession NM\_013368) is another VGAM809 host target gene. RBT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBT1 BINDING SITE, designated SEQ ID:15012, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31410] Another function of VGAM809 is therefore inhibition of RBT1 (Accession NM\_013368). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBT1. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627) is another VGAM809 host target gene. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:27335 and SEQ ID:27344 respectively, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31411] Another function of VGAM809 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC124446 (Accession XM\_058805) is another VGAM809 host target gene. LOC124446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124446 BINDING SITE, designated SEQ ID:36749, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31412] Another function of VGAM809 is therefore inhibition of LOC124446 (Accession XM\_058805). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC124446. LOC165229 (Accession XM\_092464) is another VGAM809 host target gene. LOC165229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165229 BINDING SITE, designated SEQ ID:40123, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31413] Another function of VGAM809 is therefore inhibition of LOC165229 (Accession XM\_092464). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165229. LOC165288 (Accession XM\_092498) is another VGAM809 host target gene. LOC165288 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165288 BINDING SITE, designated SEQ ID:40129, to

the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31414] Another function of VGAM809 is therefore inhibition of LOC165288 (Accession XM\_092498). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165288. LOC203871 (Accession XM\_115029) is another VGAM809 host target gene. LOC203871 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203871 BINDING SITE, designated SEQ ID:43079, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31415] Another function of VGAM809 is therefore inhibition of LOC203871 (Accession XM\_115029). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203871. LOC253128 (Accession XM\_170726) is another VGAM809 host target gene. LOC253128 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC253128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253128 BINDING SITE, designated SEQ ID:45486, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31416] Another function of VGAM809 is therefore inhibition of LOC253128 (Accession XM\_170726). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253128. LOC255714 (Accession XM\_172861) is another VGAM809 host target gene. LOC255714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255714 BINDING SITE, designated SEQ ID:46140, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31417] Another function of VGAM809 is therefore inhibition of LOC255714 (Accession XM\_172861). Accordingly, utilities

of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255714. LOC51308 (Accession NM\_016606) is another VGAM809 host target gene. LOC51308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51308 BINDING SITE, designated SEQ ID:18708, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31418] Another function of VGAM809 is therefore inhibition of LOC51308 (Accession NM\_016606). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51308. LOC90170 (Accession XM\_029589) is another VGAM809 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90170 BINDING SITE, designated SEQ ID:30910, to the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, also designated SEQ ID:3520.

[31419] Another function of VGAM809 is therefore inhibition of LOC90170 (Accession XM\_029589). Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 810 (VGAM810) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31420] VGAM810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM810 was detected is described hereinabove with reference to Figs. 1–8.

[31421] VGAM810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta Moorei Entomopoxvirus. VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31422] VGAM810 gene encodes a VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM810 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM810 precursor RNA is designated SEQ ID:796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:796 is located at position 84714 relative to the genome of Ams-acta Moorei Entomopoxvirus.

[31423] VGAM810 precursor RNA folds onto itself, forming VGAM810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31424] An enzyme complex designated DICER COMPLEX, `dices` the VGAM810 folded precursor RNA into VGAM810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM810 RNA is designated SEQ ID:3521, and is provided hereinbelow with reference to the sequence listing part.

[31425] VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM810 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31426] VGAM810 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM810 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31427] The complementary binding of VGAM810 RNA, herein designated VGAM RNA, to host target binding sites on VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM810 host target RNA into VGAM810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31428] It is appreciated that VGAM810 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM810 host target genes. The mRNA of each one of this plurality of VGAM810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM810 RNA, herein designated VGAM RNA, and which when bound by VGAM810 RNA causes inhibition of translation of respective one or more VGAM810 host target proteins.

[31429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM810 gene, herein designated VGAM GENE, on one or more VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[31430] It is yet further appreciated that a function of VGAM810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of viral infection by Amsacta Moorei Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM810 correlate with, and may be deduced from, the identity of the host target genes which VGAM810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31431] Nucleotide sequences of the VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM810 are further described hereinbelow with reference to Table 1.

[31432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM810 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31433] As mentioned hereinabove with reference to Fig. 1, a function of VGAM810 gene, herein designated VGAM is inhibition of expression of VGAM810 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM810 correlate with, and may be deduced from, the identity of the target genes which VGAM810 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31434] Aquaporin 9 (AQP9, Accession NM\_020980) is a VGAM810 host target gene. AQP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP9 BINDING SITE, designated SEQ ID:21969, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31435] A function of VGAM810 is therefore inhibition of Aqua-

porin 9 (AQP9, Accession NM\_020980). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP9. CED-6 (Accession NM\_016315) is another VGAM810 host target gene. CED-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18430, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31436] Another function of VGAM810 is therefore inhibition of CED-6 (Accession NM\_016315). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6. EPLIN (Accession NM\_016357) is another VGAM810 host target gene. EPLIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPLIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of EPLIN BINDING SITE, designated SEQ ID:18496, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31437] Another function of VGAM810 is therefore inhibition of EPLIN (Accession NM\_016357). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPLIN. FLJ11827 (Accession NM\_025093) is another VGAM810 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:24725, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31438] Another function of VGAM810 is therefore inhibition of FLJ11827 (Accession NM\_025093). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11827. KIAA0820 (Accession XM\_044463) is another VGAM810

host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34220, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31439] Another function of VGAM810 is therefore inhibition of KIAA0820 (Accession XM\_044463). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. LOC116228 (Accession XM\_057659) is another VGAM810 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:36532, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31440] Another function of VGAM810 is therefore inhibition of LOC116228 (Accession XM\_057659). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. LOC120856 (Accession XM\_058509) is another VGAM810 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36641, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31441] Another function of VGAM810 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC149711 (Accession XM\_097720) is another VGAM810 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41068, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31442] Another function of VGAM810 is therefore inhibition of LOC149711 (Accession XM\_097720). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC163782 (Accession XM\_089138) is another VGAM810 host target gene. LOC163782 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163782 BINDING SITE, designated SEQ ID:39964, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31443] Another function of VGAM810 is therefore inhibition of LOC163782 (Accession XM\_089138). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163782. LOC199675 (Accession XM\_113982) is another VGAM810 host target gene. LOC199675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199675 BINDING SITE, designated SEQ ID:42586, to the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, also designated SEQ ID:3521.

[31444] Another function of VGAM810 is therefore inhibition of LOC199675 (Accession XM\_113982). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199675. LOC253613 (Accession XM\_171225) is another VGAM810 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46012, to the nucleotide sequence of VGAM810 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3521.

[31445] Another function of VGAM810 is therefore inhibition of LOC253613 (Accession XM\_171225). Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 811 (VGAM811) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31446] VGAM811 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM811 was detected is described hereinabove with reference to Figs. 1–8.

[31447] VGAM811 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31448] VGAM811 gene encodes a VGAM811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM811 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM811 precursor RNA is designated SEQ ID:797, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:797 is located at position 161607 relative to the genome of *Melanoplus Sanguinipes* Entomopoxvirus.

[31449] VGAM811 precursor RNA folds onto itself, forming VGAM811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31450] An enzyme complex designated DICER COMPLEX, `dices` the VGAM811 folded precursor RNA into VGAM811 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM811 RNA is designated SEQ ID:3522, and is provided hereinbelow with reference to the sequence listing part.

[31451] VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM811 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[31452] VGAM811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM811 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31453] The complementary binding of VGAM811 RNA, herein designated VGAM RNA, to host target binding sites on VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM811 host target RNA into VGAM811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31454] It is appreciated that VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM811 host target genes. The mRNA of

each one of this plurality of VGAM811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM811 RNA, herein designated VGAM RNA, and which when bound by VGAM811 RNA causes inhibition of translation of respective one or more VGAM811 host target proteins.

[31455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM811 gene, herein designated VGAM GENE, on one or more VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[31456] It is yet further appreciated that a function of VGAM811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM811 correlate with, and may be deduced from, the identity of the host target genes which VGAM811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31457] Nucleotide sequences of the VGAM811 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM811 are further described hereinbelow with reference to Table 1.

[31458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM811 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM811 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[31459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM811 gene, herein designated VGAM is inhibition of expression of VGAM811 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM811 correlate with, and may be deduced from, the identity of the target genes which VGAM811 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31460] Forkhead Box D2 (FOXD2, Accession NM\_004474) is a VGAM811 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10786, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31461] A function of VGAM811 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM\_004474). Accordingly, utilities of VGAM811 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with FOXD2. Lumican (LUM, Accession NM\_002345) is another VGAM811 host target gene. LUM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LUM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUM BINDING SITE, designated SEQ ID:8144, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31462] Another function of VGAM811 is therefore inhibition of Lumican (LUM, Accession NM\_002345). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUM. Ubiquitin-conjugating Enzyme E2H (UBC8 homolog, yeast) (UBE2H, Accession NM\_003344) is another VGAM811 host target gene. UBE2H BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2H BINDING SITE,

designated SEQ ID:9351, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31463] Another function of VGAM811 is therefore inhibition of Ubiquitin-conjugating Enzyme E2H (UBC8 homolog, yeast) (UBE2H, Accession NM\_003344), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2H. The function of UBE2H has been established by previous studies. Ubiquitin-conjugating enzymes catalyze the covalent attachment of ubiquitin to cellular substrates. Kaiser et al. (1994) isolated a novel ubiquitin-conjugating enzyme from human placenta and cloned the corresponding cDNA. DNA sequencing revealed that this gene, symbolized UBCH2 by them, encodes a protein with significant sequence similarity to yeast UBC8. They discovered that yeast UBC8 is interrupted by a single intron bearing an unusual branch point sequence. The authors noted that yeast UBC8 exhibited 54% amino acid sequence identity to human UBCH2. Moreover, full-length yeast and human enzymes expressed from the cDNAs showed similar enzymatic activities in vitro by catalyzing

the ubiquitination of histones, suggesting that the 2 enzymes may fulfill similar functions in vivo. By study of hamster/human hybrid cell DNAs, Kaiser et al. (1994) demonstrated that the human UBC8 gene is located on chromosome 7. Hayashida et al. (2000) constructed a 1-Mb physical and transcript map of 7q32 and mapped UBE2H to a region between D7S530 and D7S649.

[31464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31465] Hayashida, S.; Yamasaki, K.; Asada, Y.; Soeda, E.; Niikawa, N.; Kishino, T. : Construction of a physical and transcript map flanking the imprinted MEST/PEG1 region at 7q32. Genomics 66: 221–225, 2000. ; and

[31466] Kaiser, P.; Seufert, W.; Hofferer, L.; Kofler, B.; Sachsenmaier, C.; Herzog, H.; Jentsch, S.; Schweiger, M.; Schneider, R. : Human ubiquitin-conjugating enzyme homologous to yeast UBC8.

[31467] Further studies establishing the function and utilities of UBE2H are found in John Hopkins OMIM database record ID 601082, and in cited publications numbered 9924 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 6

Open Reading Frame 37 (C6orf37, Accession XM\_041375) is another VGAM811 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33507, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31468] Another function of VGAM811 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. C6orf5 (Accession NM\_015524) is another VGAM811 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17778, to the nucleotide sequence of VGAM811 RNA,

herein designated VGAM RNA, also designated SEQ ID:3522.

[31469] Another function of VGAM811 is therefore inhibition of C6orf5 (Accession NM\_015524). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. DREV1 (Accession NM\_016025) is another VGAM811 host target gene. DREV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DREV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DREV1 BINDING SITE, designated SEQ ID:18105, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31470] Another function of VGAM811 is therefore inhibition of DREV1 (Accession NM\_016025). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DREV1. FLJ12716 (Accession NM\_021942) is another VGAM811 host target gene. FLJ12716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ12716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12716 BINDING SITE, designated SEQ ID:22457, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31471] Another function of VGAM811 is therefore inhibition of FLJ12716 (Accession NM\_021942). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12716. FLJ13920 (Accession NM\_024558) is another VGAM811 host target gene. FLJ13920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13920 BINDING SITE, designated SEQ ID:23780, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31472] Another function of VGAM811 is therefore inhibition of FLJ13920 (Accession NM\_024558). Accordingly, utilities of

VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13920. FLJ23071 (Accession NM\_025192) is another VGAM811 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:24845, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31473] Another function of VGAM811 is therefore inhibition of FLJ23071 (Accession NM\_025192). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23071. FLJ23119 (Accession NM\_024652) is another VGAM811 host target gene. FLJ23119 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23119, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23119 BINDING SITE,

designated SEQ ID:23948, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31474] Another function of VGAM811 is therefore inhibition of FLJ23119 (Accession NM\_024652). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23119. KIAA1500 (Accession XM\_034353) is another VGAM811 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32067, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31475] Another function of VGAM811 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. KIAA1615 (Accession XM\_044021) is another VGAM811 host target gene. KIAA1615 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34079, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31476] Another function of VGAM811 is therefore inhibition of KIAA1615 (Accession XM\_044021). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM\_004264) is another VGAM811 host target gene. SURB7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURB7 BINDING SITE, designated SEQ ID:10464, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31477] Another function of VGAM811 is therefore inhibition of SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM\_004264). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURB7. LOC122792 (Accession NM\_145251) is another VGAM811 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:29761, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31478] Another function of VGAM811 is therefore inhibition of LOC122792 (Accession NM\_145251). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC127435 (Accession XM\_072088) is another VGAM811 host target gene. LOC127435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127435, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127435 BINDING SITE, designated SEQ ID:37462, to the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, also designated SEQ ID:3522.

[31479] Another function of VGAM811 is therefore inhibition of LOC127435 (Accession XM\_072088). Accordingly, utilities of VGAM811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127435. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 812 (VGAM812) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31480] VGAM812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM812 was detected is described hereinabove with reference to Figs. 1-8.

[31481] VGAM812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4.

VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31482] VGAM812 gene encodes a VGAM812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM812 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM812 precursor RNA is designated SEQ ID:798, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:798 is located at position 60284 relative to the genome of Murid Herpesvirus 4.

[31483] VGAM812 precursor RNA folds onto itself, forming VGAM812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31484] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM812 folded precursor RNA into VGAM812 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM812 RNA is designated SEQ ID:3523, and is provided hereinbelow with reference to the sequence listing part.

[31485] VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM812 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31486] VGAM812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM812 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM812 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31487] The complementary binding of VGAM812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM812 host target RNA into VGAM812 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31488] It is appreciated that VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM812 host target genes. The mRNA of each one of this plurality of VGAM812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM812 RNA, herein designated VGAM RNA, and which when bound by VGAM812 RNA causes inhibition of translation of respective one or more VGAM812 host target proteins.

[31489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM812 gene, herein designated VGAM GENE, on one or more VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31490] It is yet further appreciated that a function of VGAM812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM812 correlate with, and may be deduced from, the identity of the host target genes which VGAM812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31491] Nucleotide sequences of the VGAM812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM812 are further described hereinbelow with reference to Table 1.

[31492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM812 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31493] As mentioned hereinabove with reference to Fig. 1, a function of VGAM812 gene, herein designated VGAM is inhibition of expression of VGAM812 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM812 correlate with, and may be deduced from, the identity of the target genes which VGAM812 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31494] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660) is a VGAM812 host target gene. DBY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DBY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBY BINDING SITE, designated SEQ

ID:11030, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31495] A function of VGAM812 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide, Y Chromosome (DBY, Accession NM\_004660), a gene which plays a key role in the spermatogenic process. Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBY. The function of DBY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374.Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM\_002293) is another VGAM812 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8080, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31496] Another function of VGAM812 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM\_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 has been established by previous studies. Laminin is a heterotrimeric extracellular matrix protein consisting of 3 chains: alpha (LAMA1; 150320), beta (LAMB1; 150240), and gamma (formerly A, B1, and B2, respectively). Several isoforms of each chain have been identified. Laminin gamma-1 is the most ubiquitously expressed laminin subunit (Burgeson et al., 1994; Miner et al., 1997). In mouse, the laminin subunits alpha-1, beta-1, and gamma-1 are expressed in the preimplantation embryo before the appearance of the first basement membrane of the trophectodermal epithelium. Smyth et al. (1999) targeted the LAMC1 gene by homologous recombination in mouse embryonic stem (ES) cells. Mice heterozygous for the mutation had a normal phenotype and were fertile, whereas homozygous mutant embryos did not survive beyond day 5.5 postcoitum. These embryos lacked basement membranes, and although the

blastocysts had expanded, primitive endoderm cells remained in the inner mass, and the parietal yolk sac did not develop. Cultured ES cells appeared normal after targeting both LAMC1 genes, but the embryoid bodies derived from them also lacked basement membranes, having disorganized extracellular deposits of the basement membrane proteins collagen IV and perlecan, and the cells failed to differentiate into stable myotubes. Nomenclature: Burgeson et al. (1994), a group of 14 leading researchers in the field of connective tissue proteins, adopted a new nomenclature for the laminins. They were numbered with arabic numerals in the order discovered. The previous A, B1, and B2 chains, and their isoforms, are alpha, beta, and gamma, respectively, followed by an arabic numeral to identify the isoform. For example, the first laminin identified from the Engelbreth-Holm-Swarm tumor (EHS) was designated laminin-1 with the chain composition alpha-1/beta-1/gamma-1. The genes for these 3 chains are LAMA1, LAMB1 (OMIM Ref. No. 150240), and LAMC1.

[31497] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31498] Smyth, N.; Vatansever, H. S.; Murray, P.; Meyer, M.; Frie,

C.; Paulsson, M.; Edgar, D. : Absence of basement membranes after targeting the LAMC1 gene results in embryonic lethality due to failure of endoderm differentiation. J. Cell Biol. 144: 151–160, 1999. ; and

[31499] Burgeson, R. E.; Chiquet, M.; Deutzmann, R.; Ekblom, P.; Engel, J.; Kleinman, H.; Martin, G. R.; Meneguzzi, G.; Paulsson, M.; Sanes, J.; Timpl, R.; Tryggvason, K.; Yamada, Y.; Yurchenco.

[31500] Further studies establishing the function and utilities of LAMC1 are found in John Hopkins OMIM database record ID 150290, and in cited publications numbered 11982–306 and 3913–3472 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1941 (Accession XM\_059318) is another VGAM812 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1941 BINDING SITE, designated SEQ ID:36953, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31501] Another function of VGAM812 is therefore inhibition of KIAA1941 (Accession XM\_059318). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1941. RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662) is another VGAM812 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37648, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31502] Another function of VGAM812 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_006015) is another VGAM812 host target gene.

SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE1 through SMARCF1 BINDING SITE3, designated SEQ ID:12627, SEQ ID:20525 and SEQ ID:29165 respectively, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31503] Another function of VGAM812 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_006015). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. TUSP (Accession NM\_020245) is another VGAM812 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21526, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31504] Another function of VGAM812 is therefore inhibition of TUSP (Accession NM\_020245). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC149420 (Accession XM\_086530) is another VGAM812 host target gene. LOC149420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:38749, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31505] Another function of VGAM812 is therefore inhibition of LOC149420 (Accession XM\_086530). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420. LOC90786 (Accession XM\_034127) is an-

other VGAM812 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:32014, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31506] Another function of VGAM812 is therefore inhibition of LOC90786 (Accession XM\_034127). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90786. LOC91661 (Accession NM\_138372) is another VGAM812 host target gene. LOC91661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:28751, to the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, also designated SEQ ID:3523.

[31507] Another function of VGAM812 is therefore inhibition of LOC91661 (Accession NM\_138372). Accordingly, utilities of VGAM812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 813 (VGAM813) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31508] VGAM813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM813 was detected is described hereinabove with reference to Figs. 1–8.

[31509] VGAM813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31510] VGAM813 gene encodes a VGAM813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM813

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM813 precursor RNA is designated SEQ ID:799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:799 is located at position 61060 relative to the genome of Murid Herpesvirus 4.

[31511] VGAM813 precursor RNA folds onto itself, forming VGAM813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31512] An enzyme complex designated DICER COMPLEX, `dices` the VGAM813 folded precursor RNA into VGAM813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM813 RNA is designated SEQ ID:3524, and is provided hereinbelow with reference to the sequence listing part.

[31513] VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM813 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31514] VGAM813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM813 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM813 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31515] The complementary binding of VGAM813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM813 host target RNA into VGAM813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31516] It is appreciated that VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM813 host target genes. The mRNA of each one of this plurality of VGAM813 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM813 RNA, herein designated VGAM RNA, and which when bound by VGAM813 RNA causes inhibition of translation of respective one or more VGAM813 host target proteins.

[31517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM813 gene, herein designated VGAM GENE, on one or more VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31518] It is yet further appreciated that a function of VGAM813 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM813 correlate with, and may be deduced from, the identity of the host target genes which VGAM813 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31519] Nucleotide sequences of the VGAM813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM813 are further described hereinbelow with reference to Table 1.

[31520] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM813 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM813 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[31521] As mentioned hereinabove with reference to Fig. 1, a function of VGAM813 gene, herein designated VGAM is inhibition of expression of VGAM813 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM813 correlate with, and may be deduced from, the identity of the target genes which VGAM813 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31522] Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B, Accession NM\_013450) is a VGAM813 host target gene. BAZ2B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BAZ2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ2B BINDING SITE, designated SEQ ID:15123, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31523] A function of VGAM813 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 2B (BAZ2B, Accession NM\_013450). Accordingly, utilities of VGAM813 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2B. CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM\_001310) is another VGAM813 host target gene.

CREBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:6994, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31524] Another function of VGAM813 is therefore inhibition of CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM\_001310). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231) is another VGAM813 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14873, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31525] Another function of VGAM813 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_004367) is another VGAM813 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6

BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:10574 and SEQ ID:25366 respectively, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31526] Another function of VGAM813 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_004367). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM\_084514) is another VGAM813 host target gene. HSPCAL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPCAL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPCAL3 BINDING SITE, designated SEQ ID:37619, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31527] Another function of VGAM813 is therefore inhibition of Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM\_084514). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with HSPCAL3.

KIAA1529 (Accession XM\_047336) is another VGAM813 host target gene. KIAA1529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1529 BINDING SITE, designated SEQ ID:34950, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31528] Another function of VGAM813 is therefore inhibition of KIAA1529 (Accession XM\_047336). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1529. Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM\_021127) is another VGAM813 host target gene. PMAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMAIP1 BINDING

SITE, designated SEQ ID:22101, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31529] Another function of VGAM813 is therefore inhibition of Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM\_021127). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMAIP1. LOC162333 (Accession XM\_102591) is another VGAM813 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42118, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31530] Another function of VGAM813 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC169270 (Accession XM\_095607) is an-

other VGAM813 host target gene. LOC169270 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169270 BINDING SITE, designated SEQ ID:40273, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31531] Another function of VGAM813 is therefore inhibition of LOC169270 (Accession XM\_095607). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169270. LOC220763 (Accession XM\_055551) is another VGAM813 host target gene. LOC220763 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220763 BINDING SITE, designated SEQ ID:36302, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31532] Another function of VGAM813 is therefore inhibition of LOC220763 (Accession XM\_055551). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763. LOC51277 (Accession XM\_087054) is another VGAM813 host target gene. LOC51277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51277 BINDING SITE, designated SEQ ID:39022, to the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, also designated SEQ ID:3524.

[31533] Another function of VGAM813 is therefore inhibition of LOC51277 (Accession XM\_087054). Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51277. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 814 (VGAM814) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[31534] VGAM814 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM814 was detected is described hereinabove with reference to Figs. 1–8.

[31535] VGAM814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31536] VGAM814 gene encodes a VGAM814 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM814 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM814 precursor RNA is designated SEQ ID:800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:800 is located at position 58920 relative to the genome of Murid Herpesvirus 4.

[31537] VGAM814 precursor RNA folds onto itself, forming VGAM814 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[31538] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM814 folded precursor RNA into VGAM814 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 76%) nucleotide se-  
quence of VGAM814 RNA is designated SEQ ID:3525, and  
is provided hereinbelow with reference to the sequence  
listing part.

[31539] VGAM814 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM814 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM814 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31540] VGAM814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM814 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31541] The complementary binding of VGAM814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM814 host target RNA into VGAM814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31542] It is appreciated that VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM814 host target genes. The mRNA of each one of this plurality of VGAM814 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM814 RNA, herein designated VGAM RNA, and which when bound by VGAM814 RNA causes inhibition of translation of respective one or more VGAM814 host target proteins.

[31543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM814 gene, herein designated VGAM GENE, on one or more VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31544] It is yet further appreciated that a function of VGAM814 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM814 correlate with, and may be deduced from, the identity of the host target genes which VGAM814 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [31545] Nucleotide sequences of the VGAM814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM814 are further described hereinbelow with reference to Table 1.
- [31546] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM814 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [31547] As mentioned hereinabove with reference to Fig. 1, a function of VGAM814 gene, herein designated VGAM is inhibition of expression of VGAM814 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM814 correlate with, and may be deduced from, the identity of the target genes which VGAM814 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31548] FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM\_000801) is a VGAM814 host target gene. FKBP1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ ID:6473, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31549] A function of VGAM814 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM\_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860) is another VGAM814 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FSTL3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL3 BINDING SITE, designated SEQ ID:12467, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31550] Another function of VGAM814 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL3. The function of FSTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.CGI-142 (Accession NM\_016073) is another VGAM814 host target gene. CGI-142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-142 BINDING SITE, designated SEQ ID:18146, to the nucleotide

sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31551] Another function of VGAM814 is therefore inhibition of CGI-142 (Accession NM\_016073). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-142. FLJ21777 (Accession NM\_032209) is another VGAM814 host target gene. FLJ21777 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21777 BINDING SITE, designated SEQ ID:25922, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31552] Another function of VGAM814 is therefore inhibition of FLJ21777 (Accession NM\_032209). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21777. IMP13 (Accession NM\_014652) is another VGAM814 host target gene. IMP13 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by IMP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP13 BINDING SITE, designated SEQ ID:16074, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31553] Another function of VGAM814 is therefore inhibition of IMP13 (Accession NM\_014652). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP13. KIAA1671 (Accession XM\_037809) is another VGAM814 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:32692, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31554] Another function of VGAM814 is therefore inhibition of KIAA1671 (Accession XM\_037809). Accordingly, utilities

of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. PPI5PIV (Accession NM\_019892) is another VGAM814 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21274, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31555] Another function of VGAM814 is therefore inhibition of PPI5PIV (Accession NM\_019892). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. STATI2 (Accession NM\_003877) is another VGAM814 host target gene. STATI2 BINDING SITE1 and STATI2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STATI2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STATI2

BINDING SITE1 and STATI2 BINDING SITE2, designated SEQ ID:9958 and SEQ ID:45369 respectively, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31556] Another function of VGAM814 is therefore inhibition of STATI2 (Accession NM\_003877). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STATI2. LOC201685 (Accession XM\_117325) is another VGAM814 host target gene. LOC201685 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201685 BINDING SITE, designated SEQ ID:43388, to the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, also designated SEQ ID:3525.

[31557] Another function of VGAM814 is therefore inhibition of LOC201685 (Accession XM\_117325). Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201685. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 815 (VGAM815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31558] VGAM815 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM815 was detected is described hereinabove with reference to Figs. 1–8.

[31559] VGAM815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31560] VGAM815 gene encodes a VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM815 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM815 precursor RNA is designated SEQ ID:801, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:801 is

located at position 59708 relative to the genome of Macaca Mulatta Rhadinovirus.

[31561] VGAM815 precursor RNA folds onto itself, forming VGAM815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31562] An enzyme complex designated DICER COMPLEX, `dices` the VGAM815 folded precursor RNA into VGAM815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM815 RNA is designated SEQ ID:3526, and is provided hereinbelow with reference to the sequence listing part.

[31563] VGAM815 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM815 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31564] VGAM815 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM815 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM815 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[31565] The complementary binding of VGAM815 RNA, herein designated VGAM RNA, to host target binding sites on VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM815 host target RNA into VGAM815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31566] It is appreciated that VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM815 host target genes. The mRNA of each one of this plurality of VGAM815 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM815 RNA, herein designated VGAM RNA, and which when bound by VGAM815 RNA causes inhibition of translation of respective one or more VGAM815

host target proteins.

[31567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM815 gene, herein designated VGAM GENE, on one or more VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31568] It is yet further appreciated that a function of VGAM815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM815 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadi-

novirus. Specific functions, and accordingly utilities, of VGAM815 correlate with, and may be deduced from, the identity of the host target genes which VGAM815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31569] Nucleotide sequences of the VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM815 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM815 are further described hereinbelow with reference to Table 1.

[31570] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM815 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31571] As mentioned hereinabove with reference to Fig. 1, a function of VGAM815 gene, herein designated VGAM is inhibition of expression of VGAM815 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM815 correlate with, and may be deduced from, the identity of the target genes which VGAM815 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31572] KIAA0089 (Accession XM\_046056) is a VGAM815 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34663, to the nucleotide sequence of VGAM815 RNA, herein designated VGAM RNA, also designated SEQ ID:3526.

[31573] A function of VGAM815 is therefore inhibition of KIAA0089 (Accession XM\_046056). Accordingly, utilities of VGAM815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. LOC197196 (Accession XM\_117003) is another VGAM815 host target gene. LOC197196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197196, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:43200, to the nucleotide sequence of VGAM815 RNA, herein designated VGAM RNA, also designated SEQ ID:3526.

[31574] Another function of VGAM815 is therefore inhibition of LOC197196 (Accession XM\_117003). Accordingly, utilities of VGAM815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196. LOC200982 (Accession XM\_117305) is another VGAM815 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43374, to the nucleotide sequence of VGAM815 RNA, herein designated VGAM RNA, also designated SEQ ID:3526.

[31575] Another function of VGAM815 is therefore inhibition of LOC200982 (Accession XM\_117305). Accordingly, utilities of VGAM815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200982. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 816 (VGAM816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31576] VGAM816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM816 was detected is described hereinabove with reference to Figs. 1–8.

[31577] VGAM816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31578] VGAM816 gene encodes a VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM816 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM816 precursor RNA is designated SEQ ID:802, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:802 is located at position 60360 relative to the genome of Macaca Mulatta Rhadinovirus.

[31579] VGAM816 precursor RNA folds onto itself, forming VGAM816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31580] An enzyme complex designated DICER COMPLEX, `dices` the VGAM816 folded precursor RNA into VGAM816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM816 RNA is designated SEQ ID:3527, and is provided hereinbelow with reference to the sequence listing part.

[31581] VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM816 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31582] VGAM816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM816 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[31583] The complementary binding of VGAM816 RNA, herein designated VGAM RNA, to host target binding sites on VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM816 host target RNA into VGAM816 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31584] It is appreciated that VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM816 host target genes. The mRNA of each one of this plurality of VGAM816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM816 RNA, herein designated VGAM RNA, and which when bound by VGAM816 RNA causes in-

hibition of translation of respective one or more VGAM816 host target proteins.

[31585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM816 gene, herein designated VGAM GENE, on one or more VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31586] It is yet further appreciated that a function of VGAM816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM816 include diagnosis, prevention and

treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM816 correlate with, and may be deduced from, the identity of the host target genes which VGAM816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31587] Nucleotide sequences of the VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM816 are further described hereinbelow with reference to Table 1.

[31588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM816 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM816 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31589] As mentioned hereinabove with reference to Fig. 1, a function of VGAM816 gene, herein designated VGAM is inhibition of expression of VGAM816 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM816 correlate with, and may be deduced from, the identity of the target genes which VGAM816 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31590] ADP-ribosylation Factor 4-like (ARF4L, Accession XM\_045890) is a VGAM816 host target gene. ARF4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF4L BINDING SITE, designated SEQ ID:34605, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31591] A function of VGAM816 is therefore inhibition of ADP-ribosylation Factor 4-like (ARF4L, Accession XM\_045890). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF4L. Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM\_000719) is another VGAM816 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by CACNA1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1C BINDING SITE, designated SEQ ID:6381, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31592] Another function of VGAM816 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM\_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM182. Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM\_040709) is another VGAM816 host target gene. PTGFRN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33366, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31593] Another function of VGAM816 is therefore inhibition of Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM\_040709), a gene which inhibits the binding of prostaglandin f2-alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422) is another VGAM816 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28646, SEQ ID:28654 and SEQ ID:28663 respectively, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31594] Another function of VGAM816 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759) is another VGAM816 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9839, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31595] Another function of VGAM816 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotrans-

porter, Member 4 (SLC4A4, Accession NM\_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222. Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM\_005839) is another VGAM816 host target gene. SRRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRRM1 BINDING SITE, designated SEQ ID:12452, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31596] Another function of VGAM816 is therefore inhibition of Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM\_005839). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRRM1. Transducin

(beta)-like 2 (TBL2, Accession NM\_032988) is another VGAM816 host target gene. TBL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL2 BINDING SITE, designated SEQ ID:26870, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31597] Another function of VGAM816 is therefore inhibition of Transducin (beta)-like 2 (TBL2, Accession NM\_032988), a gene which is of unknown function. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL2. The function of TBL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Translocase of Inner Mitochondrial Membrane 17 Homolog A (yeast) (TIMM17A, Accession NM\_006335) is another VGAM816 host target gene. TIMM17A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

TIMM17A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM17A BINDING SITE, designated SEQ ID:13035, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31598] Another function of VGAM816 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 17 Homolog A (yeast) (TIMM17A, Accession NM\_006335), a gene which translocates nuclear-encoded proteins into the mitochondrion. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM17A. The function of TIMM17A has been established by previous studies. By searching EST databases for homologs of yeast Tim17, Bomer et al. (1996) isolated a cDNA encoding human TIMM17A. Using similar methods, Bauer et al. (1999) also cloned a TIMM17A cDNA. Sequence analysis predicted that the 171-amino acid TIMM17A protein shares 46% amino acid identity with yeast Tim17 and contains 4 hydrophobic membrane-spanning segments, conserving the N-out/C-out topology of the yeast protein. Bauer et al.

(1999) found that TIMM17A is 76% identical to TIMM17B (OMIM Ref. No. 300249), differing primarily in the C terminus. Bomer et al. (1996) determined that TIMM17A is imported into the mitochondria via the TOMM70 rather than the more common TOMM20 (OMIM Ref. No. 601848) pathway. By Northern blot analysis, Bauer et al. (1999) detected ubiquitous expression of a 1.6-kb TIMM17A transcript that is most abundant in heart and brain, weaker in skeletal muscle, followed by pancreas, placenta, kidney, and liver. Western blot analysis showed that TIMM17A colocalizes with the inner membrane fraction of mitochondria as a 17-kD protein. Individually, TIMM17A and TIMM17B interact with TIMM23 (OMIM Ref. No. 605034), forming 2 distinct 110-kD complexes.

[31599] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31600] Bomer, U.; Rassow, J.; Zufall, N.; Pfanner, N.; Meijer, M.; Maarse, A. C. : The preprotein translocase of the inner mitochondrial membrane: evolutionary conservation of targeting and assembly of Tim17. *J. Molec. Biol.* 262: 389–395, 1996. ; and

[31601] Bauer, M. F.; Gempel, K.; Reichert, A. S.; Rappold, G. A.;

Lichtner, P.; Gerbitz, K. D.; Neupert, W.; Brunner, M.; Hofmann, S. : Genetic and structural characterization of the human mito.

[31602] Further studies establishing the function and utilities of TIMM17A are found in John Hopkins OMIM database record ID 605057, and in cited publications numbered 5030–5031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842) is another VGAM816 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9941, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31603] Another function of VGAM816 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of

VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. Zinc Finger Protein 205 (ZNF205, Accession NM\_003456) is another VGAM816 host target gene. ZNF205 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF205 BINDING SITE, designated SEQ ID:9514, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31604] Another function of VGAM816 is therefore inhibition of Zinc Finger Protein 205 (ZNF205, Accession NM\_003456). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF205. ADG-90 (Accession NM\_033069) is another VGAM816 host target gene. ADG-90 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by ADG-90, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADG-90 BINDING SITE, designated SEQ ID:26935, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31605] Another function of VGAM816 is therefore inhibition of ADG-90 (Accession NM\_033069). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADG-90. DKFZP434H132 (Accession NM\_015492) is another VGAM816 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:17762, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31606] Another function of VGAM816 is therefore inhibition of DKFZP434H132 (Accession NM\_015492). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. FLJ11155 (Accession NM\_018342) is another VGAM816 host target gene. FLJ11155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11155, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11155 BINDING SITE, designated SEQ ID:20349, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31607] Another function of VGAM816 is therefore inhibition of FLJ11155 (Accession NM\_018342). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11155. FLJ11259 (Accession NM\_018370) is another VGAM816 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20387, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31608] Another function of VGAM816 is therefore inhibition of FLJ11259 (Accession NM\_018370). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259.

FLJ20294 (Accession NM\_017749) is another VGAM816 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19353, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31609] Another function of VGAM816 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ23604 (Accession NM\_025064) is another VGAM816 host target gene. FLJ23604 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23604 BINDING SITE, designated SEQ ID:24662, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3527.

[31610] Another function of VGAM816 is therefore inhibition of FLJ23604 (Accession NM\_025064). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23604. Junctional Adhesion Molecule 1 (JAM1, Accession NM\_144501) is another VGAM816 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1 through JAM1 BINDING SITE5, designated SEQ ID:29323, SEQ ID:29332, SEQ ID:29353, SEQ ID:29343 and SEQ ID:18865 respectively, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31611] Another function of VGAM816 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM\_144501). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. KIAA0339 (Accession

XM\_049380) is another VGAM816 host target gene.

KIAA0339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0339 BINDING SITE, designated SEQ ID:35405, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31612] Another function of VGAM816 is therefore inhibition of KIAA0339 (Accession XM\_049380). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0339. KIAA0350 (Accession XM\_028332) is another VGAM816 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30673, to the nucleotide sequence of VGAM816 RNA, herein designated

VGAM RNA, also designated SEQ ID:3527.

[31613] Another function of VGAM816 is therefore inhibition of KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA1795 (Accession XM\_050988) is another VGAM816 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35704, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31614] Another function of VGAM816 is therefore inhibition of KIAA1795 (Accession XM\_050988). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. PEF (Accession NM\_012392) is another VGAM816 host target gene. PEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEF, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEF BINDING SITE, designated SEQ ID:14748, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31615] Another function of VGAM816 is therefore inhibition of PEF (Accession NM\_012392). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEF. PRIC285 (Accession XM\_028918) is another VGAM816 host target gene. PRIC285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRIC285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:30806, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31616] Another function of VGAM816 is therefore inhibition of PRIC285 (Accession XM\_028918). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRIC285. Regulator of G-protein Signalling 20 (RGS20, Accession NM\_003702) is another VGAM816 host target gene. RGS20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS20 BINDING SITE, designated SEQ ID:9803, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31617] Another function of VGAM816 is therefore inhibition of Regulator of G-protein Signalling 20 (RGS20, Accession NM\_003702). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS20. LOC120114 (Accession XM\_061871) is another VGAM816 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, desig-

nated SEQ ID:37216, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31618] Another function of VGAM816 is therefore inhibition of LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC144817 (Accession XM\_084972) is another VGAM816 host target gene. LOC144817 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144817 BINDING SITE, designated SEQ ID:37789, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31619] Another function of VGAM816 is therefore inhibition of LOC144817 (Accession XM\_084972). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144817. LOC151196 (Accession XM\_098019) is another VGAM816 host target gene. LOC151196 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151196 BINDING SITE, designated SEQ ID:41318, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31620] Another function of VGAM816 is therefore inhibition of LOC151196 (Accession XM\_098019). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151196. LOC196955 (Accession XM\_085210) is another VGAM816 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37940, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31621] Another function of VGAM816 is therefore inhibition of

LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC200081 (Accession XM\_114110) is another VGAM816 host target gene. LOC200081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200081 BINDING SITE, designated SEQ ID:42706, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31622] Another function of VGAM816 is therefore inhibition of LOC200081 (Accession XM\_114110). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200081. LOC200488 (Accession XM\_117240) is another VGAM816 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:43316, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31623] Another function of VGAM816 is therefore inhibition of LOC200488 (Accession XM\_117240). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. LOC58489 (Accession XM\_051862) is another VGAM816 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35909, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31624] Another function of VGAM816 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. LOC92609 (Accession XM\_053074) is another

VGAM816 host target gene. LOC92609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92609 BINDING SITE, designated SEQ ID:36062, to the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, also designated SEQ ID:3527.

[31625] Another function of VGAM816 is therefore inhibition of LOC92609 (Accession XM\_053074). Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 817 (VGAM817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31626] VGAM817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM817 was detected is described

hereinabove with reference to Figs. 1–8.

[31627] VGAM817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus.

VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31628] VGAM817 gene encodes a VGAM817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM817 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM817 precursor RNA is designated SEQ ID:803, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:803 is located at position 19278 relative to the genome of Monkeypox Virus.

[31629] VGAM817 precursor RNA folds onto itself, forming VGAM817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31630] An enzyme complex designated DICER COMPLEX, `dices` the VGAM817 folded precursor RNA into VGAM817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM817 RNA is designated SEQ ID:3528, and is provided hereinbelow with reference to the sequence listing part.

[31631] VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM817 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31632] VGAM817 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM817 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31633] The complementary binding of VGAM817 RNA, herein designated VGAM RNA, to host target binding sites on VGAM817 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM817 host target RNA into VGAM817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31634] It is appreciated that VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM817 host target genes. The mRNA of each one of this plurality of VGAM817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM817 RNA, herein designated VGAM RNA, and which when bound by VGAM817 RNA causes inhibition of translation of respective one or more VGAM817 host target proteins.

[31635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM817 gene, herein designated VGAM GENE, on one or more VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31636] It is yet further appreciated that a function of VGAM817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM817 correlate with, and may be deduced from, the identity of the host target genes which VGAM817 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31637] Nucleotide sequences of the VGAM817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM817 are further described hereinbelow with reference to Table 1.

[31638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM817 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM817 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31639] As mentioned hereinabove with reference to Fig. 1, a function of VGAM817 gene, herein designated VGAM is inhibition of expression of VGAM817 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM817 correlate with, and may be deduced from, the identity of the target genes which VGAM817 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31640] Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958) is a VGAM817 host target gene. AMFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMFR, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE, designated SEQ ID:29064, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31641] A function of VGAM817 is therefore inhibition of Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958), a gene which acts to stimulate migration of fibrosarcoma cells. Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMFR. The function of AMFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM440. Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275) is another VGAM817 host target gene. CHGA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHGA BINDING SITE, designated SEQ ID:6939, to the nucleotide sequence of

VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31642] Another function of VGAM817 is therefore inhibition of Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275), a gene which regulates dense-core secretory granule biogenesis and hormone sequestration . Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHGA. The function of CHGA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM440.Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM\_040465) is another VGAM817 host target gene. F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:33297, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31643] Another function of VGAM817 is therefore inhibition of Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM\_040465), a gene which functions in normal hemostasis. Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3. The function of F3 has been established by previous studies. Factor III, a glycoprotein component of cell membranes, is an essential cofactor for factor VII-dependent activation of blood coagulation and activates the extrinsic pathway of blood coagulation in the presence of factor XII and calcium. It may be the primary physiologic initiator of blood coagulation. This may explain why factor III is the only protein in the coagulation pathway for which a congenital deficiency has not been described. Carson et al. (1985) mapped F3 to 1pter-p21 by study of somatic cell hybrids with a species-specific sensitive chromogenic assay. Spicer et al. (1987) isolated cDNA clones for tissue factor. The amino acid sequence deduced from the nucleotide sequence of the cDNAs indicates that tissue factor is synthesized as a higher molecular weight precursor with a leader sequence of 32 amino acids, while the sequence of the mature protein suggests that there are 3 distinct domains: extracellular

(residues 1–219), hydrophobic (residues 220–242), and cytoplasmic (residues 243–263). Scarpati et al. (1987) screened a human placenta cDNA library in lambda-gt11 for expression of tissue factor antigens. Among 4 million recombinant clones screened, one that was positive expressed a protein that shares epitopes with authentic human brain tissue factor. The 1.1-kb cDNA insert encodes a peptide containing the N-terminal protein sequence of brain tissue factor. By means of this clone used in hybridization to flow-sorted human chromosomes, Scarpati et al. (1987) showed that the tissue factor gene is located on chromosome 1. Scarpati et al. (1987) used a RFLP to map factor 3 to proximal 1p by multipoint linkage analysis with probes known to span that region. Judging by the location arrived at by somatic cell hybridization, the location of F3 may be in the region 1p22–p21. By in situ hybridization, Kao et al. (1988) likewise mapped F3 to 1p22–p21. Mackman et al. (1989) presented the complete sequence of the F3 gene. It is 12.4 kb long and has 6 exons separated by 5 introns. Mackman et al. (1990) concluded that the tissue factor promoter is relatively complex. Tissue factor (TF) is an integral membrane glycoprotein that, when exposed to plasma, is a potent procoagu-

lant. As stated earlier, it is believed to be the physiologic initiator of blood coagulation. Toomey et al. (1997) found that, in contrast to findings of earlier studies which showed that TF-null mouse embryos did not survive beyond midgestation, 14% of TF-deficient embryos from a hybrid background escaped this early mortality and survived to birth. On gross and microscopic inspection, these late gestation, TF-deficient embryos appeared normal. Furthermore, the growth and vascularity of TF +/+, TF +/-, and TF -/- teratomas and teratocarcinomas were indistinguishable. Toomey et al. (1997) concluded that tumor-derived TF is not required for tumor growth and angiogenesis and that the combined data do not support an essential role for TF in embryonic vascular development.

[31644] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31645] Mackman, N.; Fowler, B. J.; Edgington, T. S.; Morrissey, J. H. : Functional analysis of the human tissue factor promoter and induction by serum. Proc. Nat. Acad. Sci. 87: 2254-2258, 1990. ; and

[31646] Toomey, J. R.; Kratzer, K. E.; Lasky, N. M.; Broze, G. J., Jr. : Effect of tissue factor deficiency on mouse and tumor de-

velopment. Proc. Nat. Acad. Sci. 94: 6922–6926, 1997.

[31647] Further studies establishing the function and utilities of F3 are found in John Hopkins OMIM database record ID 134390, and in cited publications numbered 95–9 and 3181–91 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Junctophilin 3 (JPH3, Accession NM\_020655) is another VGAM817 host target gene. JPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JPH3 BINDING SITE, designated SEQ ID:21825, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31648] Another function of VGAM817 is therefore inhibition of Junctophilin 3 (JPH3, Accession NM\_020655), a gene which is involved in cytoskeletal organization and cellular growth. Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JPH3. The function of JPH3 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM254. Zinc Finger Protein 192 (ZNF192, Accession NM\_006298) is another VGAM817 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12988, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31649] Another function of VGAM817 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM\_006298). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965) is another VGAM817 host target gene. C1orf17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of C1orf17 BINDING SITE, designated SEQ ID:33852, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31650] Another function of VGAM817 is therefore inhibition of Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf17. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 1 (ELOVL1, Accession NM\_022821) is another VGAM817 host target gene. ELOVL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELOVL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL1 BINDING SITE, designated SEQ ID:23099, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31651] Another function of VGAM817 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 1 (ELOVL1, Accession NM\_022821).

Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL1. FLJ10842 (Accession NM\_018238) is another VGAM817 host target gene. FLJ10842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10842 BINDING SITE, designated SEQ ID:20187, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31652] Another function of VGAM817 is therefore inhibition of FLJ10842 (Accession NM\_018238). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10842. FLJ22969 (Accession XM\_044006) is another VGAM817 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34067, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31653] Another function of VGAM817 is therefore inhibition of FLJ22969 (Accession XM\_044006). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22969. FLJ23519 (Accession NM\_032240) is another VGAM817 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:25971, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31654] Another function of VGAM817 is therefore inhibition of FLJ23519 (Accession NM\_032240). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. KIAA0876 (Accession XM\_035625) is another VGAM817

host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32294, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31655] Another function of VGAM817 is therefore inhibition of KIAA0876 (Accession XM\_035625). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA0961 (Accession NM\_014898) is another VGAM817 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17071, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31656] Another function of VGAM817 is therefore inhibition of KIAA0961 (Accession NM\_014898). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. KIAA1265 (Accession XM\_047707) is another VGAM817 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE, designated SEQ ID:35034, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31657] Another function of VGAM817 is therefore inhibition of KIAA1265 (Accession XM\_047707). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. KIAA1678 (Accession XM\_051221) is another VGAM817 host target gene. KIAA1678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1678, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1678 BINDING SITE, designated SEQ ID:35788, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31658] Another function of VGAM817 is therefore inhibition of KIAA1678 (Accession XM\_051221). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1678. RAB17, Member RAS Oncogene Family (RAB17, Accession NM\_022449) is another VGAM817 host target gene. RAB17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB17 BINDING SITE, designated SEQ ID:22787, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31659] Another function of VGAM817 is therefore inhibition of RAB17, Member RAS Oncogene Family (RAB17, Accession NM\_022449). Accordingly, utilities of VGAM817 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB17. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM\_007231) is another VGAM817 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:14100, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31660] Another function of VGAM817 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM\_007231). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. LOC146229 (Accession XM\_085387) is another VGAM817 host target gene. LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146229, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE1 and LOC146229 BINDING SITE2, designated SEQ ID:38104 and SEQ ID:38105 respectively, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31661] Another function of VGAM817 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC164395 (Accession XM\_092778) is another VGAM817 host target gene. LOC164395 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164395 BINDING SITE, designated SEQ ID:40145, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31662] Another function of VGAM817 is therefore inhibition of LOC164395 (Accession XM\_092778). Accordingly, utilities

of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164395. LOC196337 (Accession XM\_113696) is another VGAM817 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42358, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31663] Another function of VGAM817 is therefore inhibition of LOC196337 (Accession XM\_113696). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC200197 (Accession XM\_114148) is another VGAM817 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200197 BINDING SITE, designated SEQ ID:42730, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31664] Another function of VGAM817 is therefore inhibition of LOC200197 (Accession XM\_114148). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. LOC200681 (Accession XM\_117260) is another VGAM817 host target gene. LOC200681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200681 BINDING SITE, designated SEQ ID:43341, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31665] Another function of VGAM817 is therefore inhibition of LOC200681 (Accession XM\_117260). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200681. LOC51301 (Accession NM\_016591) is another VGAM817 host target gene. LOC51301 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18670, to the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, also designated SEQ ID:3528.

[31666] Another function of VGAM817 is therefore inhibition of LOC51301 (Accession NM\_016591). Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 818 (VGAM818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31667] VGAM818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM818 was detected is described hereinabove with reference to Figs. 1-8.

[31668] VGAM818 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus.

VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31669] VGAM818 gene encodes a VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM818 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM818 precursor RNA is designated SEQ ID:804, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:804 is located at position 27338 relative to the genome of Monkeypox Virus.

[31670] VGAM818 precursor RNA folds onto itself, forming VGAM818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[31671] An enzyme complex designated DICER COMPLEX, `dices` the VGAM818 folded precursor RNA into VGAM818 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM818 RNA is designated SEQ ID:3529, and is provided hereinbelow with reference to the sequence listing part.

[31672] VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM818 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31673] VGAM818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM818 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM818 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31674] The complementary binding of VGAM818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM818 host target RNA into VGAM818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31675] It is appreciated that VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM818 host target genes. The mRNA of each one of this plurality of VGAM818 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM818 RNA, herein designated VGAM RNA, and which when bound by VGAM818 RNA causes inhibition of translation of respective one or more VGAM818 host target proteins.

[31676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM818 gene, herein designated VGAM GENE, on one or more VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31677] It is yet further appreciated that a function of VGAM818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM818 correlate with, and may be deduced from, the identity of the host target genes which VGAM818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31678] Nucleotide sequences of the VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM818 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM818 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM818 are further described hereinbelow with reference to Table 1.

[31679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM818 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31680] As mentioned hereinabove with reference to Fig. 1, a function of VGAM818 gene, herein designated VGAM is inhibition of expression of VGAM818 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM818 correlate with, and may be deduced from, the identity of the target genes which VGAM818 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31681] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649) is a VGAM818 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7353, to the nucleotide sequence of VGAM818 RNA, herein designated VGAM RNA, also designated SEQ ID:3529.

[31682] A function of VGAM818 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.LOC150142 (Accession XM\_086791) is another VGAM818 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38849, to the nucleotide sequence of VGAM818 RNA, herein designated VGAM RNA, also designated SEQ ID:3529.

[31683] Another function of VGAM818 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC202316 (Accession XM\_117380) is another VGAM818 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43424, to the nucleotide sequence of VGAM818 RNA, herein designated VGAM RNA, also designated SEQ ID:3529.

[31684] Another function of VGAM818 is therefore inhibition of LOC202316 (Accession XM\_117380). Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. LOC90190 (Accession XM\_029758) is another VGAM818 host target gene. LOC90190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90190, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90190 BINDING SITE, designated SEQ ID:30945, to the nucleotide sequence of VGAM818 RNA, herein designated VGAM RNA, also designated SEQ ID:3529.

[31685] Another function of VGAM818 is therefore inhibition of LOC90190 (Accession XM\_029758). Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 819 (VGAM819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31686] VGAM819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM819 was detected is described hereinabove with reference to Figs. 1–8.

[31687] VGAM819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM819 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[31688] VGAM819 gene encodes a VGAM819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM819 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM819 precursor RNA is designated SEQ ID:805, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:805 is located at position 92255 relative to the genome of Ate-line Herpesvirus 3.

[31689] VGAM819 precursor RNA folds onto itself, forming VGAM819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31690] An enzyme complex designated DICER COMPLEX, `dices` the VGAM819 folded precursor RNA into VGAM819 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM819 RNA is designated SEQ ID:3530, and is provided hereinbelow with reference to the sequence listing part.

[31691] VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM819 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31692] VGAM819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM819 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31693] The complementary binding of VGAM819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM819 host target RNA into VGAM819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31694] It is appreciated that VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM819 host target genes. The mRNA of each one of this plurality of VGAM819 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM819 RNA, herein designated VGAM RNA, and which when bound by VGAM819 RNA causes inhibition of translation of respective one or more VGAM819 host target proteins.

[31695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM819 gene, herein designated VGAM GENE, on one or more VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31696] It is yet further appreciated that a function of VGAM819 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM819 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM819 correlate with, and may be deduced from, the identity of the host target genes which VGAM819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31697] Nucleotide sequences of the VGAM819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM819 are further described hereinbelow with reference to Table 1.

[31698] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM819 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31699] As mentioned hereinabove with reference to Fig. 1, a function of VGAM819 gene, herein designated VGAM is inhibition of expression of VGAM819 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM819 correlate with, and may be deduced from, the identity of the target genes which VGAM819 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31700] Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109) is a VGAM819 host target gene. DMD BINDING SITE1 through DMD BINDING SITE13 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE13, designated SEQ

ID:5575, SEQ ID:10158, SEQ ID:10165, SEQ ID:10189, SEQ ID:10206, SEQ ID:10179, SEQ ID:10216, SEQ ID:10240, SEQ ID:10228, SEQ ID:10171, SEQ ID:10184, SEQ ID:10211 and SEQ ID:10201 respectively, to the nucleotide sequence of VGAM819 RNA, herein designated VGAM RNA, also designated SEQ ID:3530.

[31701] A function of VGAM819 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.SSH2 (Accession XM\_030846) is another VGAM819 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31189, to the nucleotide sequence of VGAM819 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3530.

[31702] Another function of VGAM819 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC123036 (Accession XM\_058676) is another VGAM819 host target gene. LOC123036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123036 BINDING SITE, designated SEQ ID:36719, to the nucleotide sequence of VGAM819 RNA, herein designated VGAM RNA, also designated SEQ ID:3530.

[31703] Another function of VGAM819 is therefore inhibition of LOC123036 (Accession XM\_058676). Accordingly, utilities of VGAM819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123036. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 820 (VGAM820) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31704] VGAM820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM820 was detected is described hereinabove with reference to Figs. 1–8.

[31705] VGAM820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31706] VGAM820 gene encodes a VGAM820 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM820 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM820 precursor RNA is designated SEQ ID:806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:806 is located at position 97653 relative to the genome of Saimiriine Herpesvirus 2.

[31707] VGAM820 precursor RNA folds onto itself, forming

VGAM820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31708] An enzyme complex designated DICER COMPLEX, `dices` the VGAM820 folded precursor RNA into VGAM820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM820 RNA is designated SEQ ID:3531, and is provided hereinbelow with reference to the sequence listing part.

[31709] VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM820 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31710] VGAM820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM820 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM820 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31711] The complementary binding of VGAM820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM820 host target RNA into VGAM820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31712] It is appreciated that VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM820 host target genes. The mRNA of each one of this plurality of VGAM820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM820 RNA, herein designated VGAM RNA, and which when bound by VGAM820 RNA causes inhibition of translation of respective one or more VGAM820 host target proteins.

[31713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM820 gene, herein designated VGAM GENE, on one or more VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31714] It is yet further appreciated that a function of VGAM820 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM820 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM820 correlate with, and may be deduced from, the identity of the host target genes which VGAM820 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[31715] Nucleotide sequences of the VGAM820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM820 are further described hereinbelow with reference to Table 1.

[31716] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM820 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31717] As mentioned hereinabove with reference to Fig. 1, a function of VGAM820 gene, herein designated VGAM is inhibition of expression of VGAM820 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM820 correlate with, and may be deduced from, the identity of the target genes which VGAM820 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[31718] Kelch-like 3 (Drosophila) (KLHL3, Accession XM\_113450) is a VGAM820 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42265, to the nucleotide sequence of VGAM820 RNA, herein designated VGAM RNA, also designated SEQ ID:3531.

[31719] A function of VGAM820 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM\_113450). Accordingly, utilities of VGAM820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. Protocadherin 11 X-linked (PCDH11X, Accession NM\_032969) is another VGAM820 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26801 and SEQ ID:26786 respectively, to the nucleotide sequence of VGAM820 RNA, herein designated VGAM RNA, also designated SEQ ID:3531.

[31720] Another function of VGAM820 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM\_032969), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.FLJ12476 (Accession NM\_022784) is another VGAM820 host target gene. FLJ12476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12476 BINDING SITE, designated SEQ ID:23067, to the nucleotide

sequence of VGAM820 RNA, herein designated VGAM RNA, also designated SEQ ID:3531.

- [31721] Another function of VGAM820 is therefore inhibition of FLJ12476 (Accession NM\_022784). Accordingly, utilities of VGAM820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12476. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 821 (VGAM821) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [31722] VGAM821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM821 was detected is described hereinabove with reference to Figs. 1–8.
- [31723] VGAM821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [31724] VGAM821 gene encodes a VGAM821 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM821 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM821 precursor RNA is designated SEQ ID:807, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:807 is located at position 120037 relative to the genome of Human Herpesvirus 6.

[31725] VGAM821 precursor RNA folds onto itself, forming VGAM821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31726] An enzyme complex designated DICER COMPLEX, `dices` the VGAM821 folded precursor RNA into VGAM821 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM821 RNA is designated SEQ ID:3532, and is provided hereinbelow with reference to the sequence listing part.

[31727] VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM821 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31728] VGAM821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM821 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM821 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31729] The complementary binding of VGAM821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM821 host target RNA into VGAM821 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31730] It is appreciated that VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM821 host target genes. The mRNA of

each one of this plurality of VGAM821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM821 RNA, herein designated VGAM RNA, and which when bound by VGAM821 RNA causes inhibition of translation of respective one or more VGAM821 host target proteins.

[31731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM821 gene, herein designated VGAM GENE, on one or more VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[31732] It is yet further appreciated that a function of VGAM821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM821 correlate with, and may be deduced from, the identity of the host target genes which VGAM821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31733] Nucleotide sequences of the VGAM821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM821 are further described hereinbelow with reference to Table 1.

[31734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM821 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM821 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[31735] As mentioned hereinabove with reference to Fig. 1, a function of VGAM821 gene, herein designated VGAM is inhibition of expression of VGAM821 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM821 correlate with, and may be deduced from, the identity of the target genes which VGAM821 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31736] Deoxyguanosine Kinase (DGUOK, Accession NM\_080915) is a VGAM821 host target gene. DGUOK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGUOK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGUOK BINDING SITE, designated SEQ ID:28133, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31737] A function of VGAM821 is therefore inhibition of Deoxyguanosine Kinase (DGUOK, Accession NM\_080915), a gene which is deoxyguanosine kinase and mediates phos-

phorylation of several deoxyribonucleosides. Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGUOK. The function of DGUOK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM121. Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM\_007336) is another VGAM821 host target gene. DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, designated SEQ ID:14263 and SEQ ID:14269 respectively, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31738] Another function of VGAM821 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM\_007336). Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with DLEC1. Neuronal Pentraxin I (NPTX1, Accession NM\_002522) is another VGAM821 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8352, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31739] Another function of VGAM821 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM\_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169) is another VGAM821 host target gene. SUFU BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18249, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31740] Another function of VGAM821 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169). Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. CG012 (Accession XM\_096710) is another VGAM821 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40491, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31741] Another function of VGAM821 is therefore inhibition of CG012 (Accession XM\_096710). Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. FLJ20396 (Accession NM\_017801) is another VGAM821 host target gene. FLJ20396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20396 BINDING SITE, designated SEQ ID:19445, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31742] Another function of VGAM821 is therefore inhibition of FLJ20396 (Accession NM\_017801). Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20396. KIAA0276 (Accession XM\_048199) is another VGAM821 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35134, to the nucleotide sequence of VGAM821 RNA, herein designated VGAM RNA, also designated SEQ ID:3532.

[31743] Another function of VGAM821 is therefore inhibition of KIAA0276 (Accession XM\_048199). Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 822 (VGAM822) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31744] VGAM822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM822 was detected is described hereinabove with reference to Figs. 1–8.

[31745] VGAM822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM822 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[31746] VGAM822 gene encodes a VGAM822 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM822 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM822 precursor RNA is designated SEQ ID:808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:808 is located at position 117925 relative to the genome of Human Herpesvirus 6.

[31747] VGAM822 precursor RNA folds onto itself, forming VGAM822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31748] An enzyme complex designated DICER COMPLEX, `dices` the VGAM822 folded precursor RNA into VGAM822 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM822 RNA is designated SEQ ID:3533, and is provided hereinbelow with reference to the sequence listing part.

[31749] VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM822 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31750] VGAM822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM822 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM822 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31751] The complementary binding of VGAM822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM822 host target RNA into VGAM822 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[31752] It is appreciated that VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM822 host target genes. The mRNA of each one of this plurality of VGAM822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM822 RNA, herein designated VGAM RNA, and which when bound by VGAM822 RNA causes inhibition of translation of respective one or more VGAM822 host target proteins.

[31753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM822 gene, herein designated VGAM GENE, on one or more VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31754] It is yet further appreciated that a function of VGAM822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM822 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM822 correlate with, and may be deduced from, the identity of the host target genes which VGAM822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31755] Nucleotide sequences of the VGAM822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM822 are further described hereinbelow with reference to Table 1.

[31756] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM822 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31757] As mentioned hereinabove with reference to Fig. 1, a function of VGAM822 gene, herein designated VGAM is inhibition of expression of VGAM822 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM822 correlate with, and may be deduced from, the identity of the target genes which VGAM822 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31758] V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM\_005360) is a VGAM822 host target gene. MAF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAF BINDING SITE, designated SEQ ID:11838, to the nucleotide sequence of VGAM822

RNA, herein designated VGAM RNA, also designated SEQ ID:3533.

[31759] A function of VGAM822 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM\_005360), a gene which is a transcription factor; contains a leucine zipper motif. Accordingly, utilities of VGAM822 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAF. The function of MAF has been established by previous studies. Nishizawa et al. (1989) identified in the human genome a cellular analog of v-maf which was isolated from the provirus of the avian musculoaponeurotic fibrosarcoma virus AS42. The deduced amino acid sequence of the v-maf gene product contains a leucine zipper motif similar to that found in a number of DNA binding proteins, including the gene products of the FOS (OMIM Ref. No. 164810), JUN (OMIM Ref. No. 165160), and MYC (OMIM Ref. No. 190080) oncogenes. Through the use of a cDNA probe for in situ hybridization, Yoshida et al. (1991) localized the MAF gene to 16q22-q23. Blank and Andrews (1997) reviewed the MAF transcription factors, a unique subclass of basic-leucine zipper transcription (bZIP) factors. Members of the MAF

family appear to play important roles in the regulation of differentiation. Human congenital cataract and ocular anterior segment dysgenesis both demonstrate extensive genetic and phenotypic heterogeneity. Kim et al. (1999) demonstrated that the homozygous null mutant Maf mouse embryo exhibits defective lens formation and microphthalmia. Jamieson et al. (2002) identified a family where ocular developmental abnormalities (cataract, anterior segment dysgenesis, and microphthalmia) cosegregated with a translocation, t(5;16)(p15.3;q23.2), in both balanced and unbalanced forms. Cloning the 16q23.2 breakpoint demonstrated that it transected the genomic-control domain of MAF. The 16q23.2 breakpoint transected the common fragile site FRA16D (see OMIM Ref. No. 605131), providing a molecular demonstration of a germline break in a common fragile site. Through mutation screening of a panel of patients with hereditary congenital cataract, Jamieson et al. (2002) identified a mutation in the MAF gene in a 3-generation family with cataract, microcornea, and iris coloboma

[31760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [31761] Jamieson, R. V.; Perveen, R.; Kerr, B.; Carette, M.; Yardley, J.; Heon, E.; Wirth, M. G.; van Heyningen, V.; Donnai, D.; Munier, F.; Black, G. C. M. : Domain disruption and mutation of the bZIP transcription factor, MAF, associated with cataract, ocular anterior segment dysgenesis and coloboma. *Hum. Molec. Genet.* 11: 33–42, 2002. ; and

- [31763] Further studies establishing the function and utilities of MAF are found in John Hopkins OMIM database record ID 177075, and in cited publications numbered 10095–10099 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM822 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GRIN3A BINDING SITE, designated SEQ ID:28532, to the nucleotide sequence of VGAM822 RNA, herein designated VGAM RNA, also designated SEQ ID:3533.

[31764] Another function of VGAM822 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM822 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA1879 (Accession XM\_056635) is another VGAM822 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36408, to the nucleotide sequence of VGAM822 RNA, herein designated VGAM RNA, also designated SEQ ID:3533.

[31765] Another function of VGAM822 is therefore inhibition of KIAA1879 (Accession XM\_056635). Accordingly, utilities of VGAM822 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 823 (VGAM823) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31766] VGAM823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM823 was detected is described hereinabove with reference to Figs. 1–8.

[31767] VGAM823 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31768] VGAM823 gene encodes a VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM823 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM823 precursor RNA is designated SEQ ID:809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:809 is

located at position 2329 relative to the genome of African Swine Fever Virus.

[31769] VGAM823 precursor RNA folds onto itself, forming VGAM823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31770] An enzyme complex designated DICER COMPLEX, `dices` the VGAM823 folded precursor RNA into VGAM823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM823 RNA is designated SEQ ID:3534, and is provided hereinbelow with reference to the sequence listing part.

[31771] VGAM823 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM823 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31772] VGAM823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM823 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM823 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM823 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31773] The complementary binding of VGAM823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM823 host target RNA into VGAM823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31774] It is appreciated that VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM823 host target genes. The mRNA of each one of this plurality of VGAM823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM823 RNA, herein designated VGAM RNA, and which when bound by VGAM823 RNA causes inhibition of translation of respective one or more VGAM823

host target proteins.

[31775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM823 gene, herein designated VGAM GENE, on one or more VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31776] It is yet further appreciated that a function of VGAM823 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM823 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus.

Specific functions, and accordingly utilities, of VGAM823 correlate with, and may be deduced from, the identity of the host target genes which VGAM823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [31777] Nucleotide sequences of the VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM823 are further described hereinbelow with reference to Table 1.
- [31778] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM823 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [31779] As mentioned hereinabove with reference to Fig. 1, a function of VGAM823 gene, herein designated VGAM is inhibition of expression of VGAM823 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM823 correlate with, and may be deduced from, the identity of the target genes which VGAM823 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31780] Nuclear Factor I/A (NFIA, Accession XM\_046827) is a VGAM823 host target gene. NFIA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIA BINDING SITE, designated SEQ ID:34839, to the nucleotide sequence of VGAM823 RNA, herein designated VGAM RNA, also designated SEQ ID:3534.

[31781] A function of VGAM823 is therefore inhibition of Nuclear Factor I/A (NFIA, Accession XM\_046827). Accordingly, utilities of VGAM823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIA. DKFZP434A043 (Accession NM\_015396) is another VGAM823 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434A043, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17700, to the nucleotide sequence of VGAM823 RNA, herein designated VGAM RNA, also designated SEQ ID:3534.

[31782] Another function of VGAM823 is therefore inhibition of DKFZP434A043 (Accession NM\_015396). Accordingly, utilities of VGAM823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A043. LOC201799 (Accession XM\_114380) is another VGAM823 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42912, to the nucleotide sequence of VGAM823 RNA, herein designated VGAM RNA, also designated SEQ ID:3534.

[31783] Another function of VGAM823 is therefore inhibition of LOC201799 (Accession XM\_114380). Accordingly, utilities of VGAM823 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC201799. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 824 (VGAM824) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31784] VGAM824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM824 was detected is described hereinabove with reference to Figs. 1–8.

[31785] VGAM824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31786] VGAM824 gene encodes a VGAM824 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM824 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM824 precursor RNA is designated SEQ

ID:810, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:810 is located at position 3473 relative to the genome of African Swine Fever Virus.

[31787] VGAM824 precursor RNA folds onto itself, forming VGAM824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31788] An enzyme complex designated DICER COMPLEX, `dices` the VGAM824 folded precursor RNA into VGAM824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM824 RNA is designated SEQ ID:3535, and is provided hereinbelow with reference to the sequence

listing part.

[31789] VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM824 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31790] VGAM824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM824 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM824 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31791] The complementary binding of VGAM824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM824 host target RNA into VGAM824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31792] It is appreciated that VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM824 host target genes. The mRNA of each one of this plurality of VGAM824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM824 RNA, herein designated VGAM

RNA, and which when bound by VGAM824 RNA causes inhibition of translation of respective one or more VGAM824 host target proteins.

[31793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM824 gene, herein designated VGAM GENE, on one or more VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31794] It is yet further appreciated that a function of VGAM824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM824 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM824 correlate with, and may be deduced from, the identity of the host target genes which VGAM824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31795] Nucleotide sequences of the VGAM824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM824 are further described hereinbelow with reference to Table 1.

[31796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM824 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31797] As mentioned hereinabove with reference to Fig. 1, a function of VGAM824 gene, herein designated VGAM is

inhibition of expression of VGAM824 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM824 correlate with, and may be deduced from, the identity of the target genes which VGAM824 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31798] Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM\_004086) is a VGAM824 host target gene. COCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COCH BINDING SITE, designated SEQ ID:10290, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31799] A function of VGAM824 is therefore inhibition of Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM\_004086). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COCH. Fyn-related Kinase (FRK, Accession NM\_002031) is an-

other VGAM824 host target gene. FRK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRK BINDING SITE, designated SEQ ID:7786, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31800] Another function of VGAM824 is therefore inhibition of Fyn-related Kinase (FRK, Accession NM\_002031), a gene which binds pRb (RB1) during G1 and S phase and suppresses growth. Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRK. The function of FRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM157. Sequestosome 1 (SQSTM1, Accession NM\_003900) is another VGAM824 host target gene. SQSTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SQSTM1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQSTM1 BINDING SITE, designated SEQ ID:9987, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31801] Another function of VGAM824 is therefore inhibition of Sequestosome 1 (SQSTM1, Accession NM\_003900), a gene which binds SH2 domain of p56lck and ubiquitin, and it is associated with a serine/threonine kinase activity. Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQSTM1. The function of SQSTM1 has been established by previous studies. Using 24 French Canadian families and 112 unrelated individuals with Paget disease of bone (OMIM Ref. No. 602080), Laurin et al. (2002) confined the PDB3 locus (OMIM Ref. No. 606262) on 5q35-qter to a region of approximately 300 kb. Within this interval, 2 disease-related haplotype signatures were observed in 11 families and 18 unrelated patients. This region encoded the SQSTM1 gene, which is a candidate gene for PDB because of its association with the RANK pathway (see OMIM Ref. No. 603499). Screening SQSTM1

for mutations led to the identification of a recurrent non-conservative change (P392L; 601530.0001) flanking the ubiquitin-associated domain (UBA; position 394–440) of the protein that was not present in 291 control individuals. The data demonstrated that 2 independent mutational events at the same position in SQSTM1 cause Paget disease of bone in a high proportion of French Canadian patients. The Src homology type 2 (SH2) domain is a highly conserved motif of about 100 amino acids which mediates protein–protein interactions by binding to phosphotyrosine. p56–lck (OMIM Ref. No. 153390), a T–cell–specific src family tyrosine kinase with an SH2 domain, is involved in T–cell signal transduction. A 62–kD protein (p62) was identified by Park et al. (1995) as a ligand of the p56–lck SH2 domain. Park et al. (1995) found that the p56–lck SH2 domain binds to p62 at the ser59 of p62 only when that serine is phosphorylated. Moreover, Park et al. (1995) found that p62 is associated with a serine/threonine kinase activity and also binds to ras GTP–ase–activating protein, a negative regulator of the ras signaling pathway.

[31802] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [31803] Laurin, N.; Brown, J. P.; Morissette, J.; Raymond, V. : Re-current mutation of the gene encoding sequestosome 1 (SQSTM1/p62) in Paget disease of bone. *Am. J. Hum. Genet.* 70: 1582–1588, 2002. ; and
- [31804] Park, I.; Chung, J.; Walsh, C. T.; Yun, Y.; Strominger, J. L.; Shin, J. : Phosphotyrosine-independent binding of a 62-kDa protein to the src homology 2 (SH2) domain of p56-lck and its regu.
- [31805] Further studies establishing the function and utilities of SQSTM1 are found in John Hopkins OMIM database record ID 601530, and in cited publications numbered 154 and 7189–7192 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Titin (TTN, Accession NM\_133378) is another VGAM824 host target gene. TTN BINDING SITE1 through TTN BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TTN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTN BINDING SITE1 through TTN BINDING SITE3, designated SEQ ID:28501, SEQ ID:28506 and SEQ ID:28516 respectively, to the nucleotide sequence of VGAM824 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3535.

[31806] Another function of VGAM824 is therefore inhibition of Titin (TTN, Accession NM\_133378). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTN. DKFZP434O047 (Accession NM\_015594) is another VGAM824 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17861, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31807] Another function of VGAM824 is therefore inhibition of DKFZP434O047 (Accession NM\_015594). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM824 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12212, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31808] Another function of VGAM824 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FENS-1 (Accession NM\_020830) is another VGAM824 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21895, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31809] Another function of VGAM824 is therefore inhibition of FENS-1 (Accession NM\_020830). Accordingly, utilities of

VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. KIAA1432 (Accession XM\_039698) is another VGAM824 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33146, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31810] Another function of VGAM824 is therefore inhibition of KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. Stromal Antigen 2 (STAG2, Accession XM\_047285) is another VGAM824 host target gene. STAG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of STAG2 BINDING SITE, designated SEQ ID:34927, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31811] Another function of VGAM824 is therefore inhibition of Stromal Antigen 2 (STAG2, Accession XM\_047285). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG2. LOC255654 (Accession XM\_173036) is another VGAM824 host target gene. LOC255654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255654 BINDING SITE, designated SEQ ID:46301, to the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, also designated SEQ ID:3535.

[31812] Another function of VGAM824 is therefore inhibition of LOC255654 (Accession XM\_173036). Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255654. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 825 (VGAM825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31813] VGAM825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM825 was detected is described hereinabove with reference to Figs. 1–8.

[31814] VGAM825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31815] VGAM825 gene encodes a VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM825 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM825 precursor RNA is designated SEQ ID:811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:811 is

located at position 80642 relative to the genome of Monkeypox Virus.

[31816] VGAM825 precursor RNA folds onto itself, forming VGAM825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31817] An enzyme complex designated DICER COMPLEX, `dices` the VGAM825 folded precursor RNA into VGAM825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM825 RNA is designated SEQ ID:3536, and is provided hereinbelow with reference to the sequence listing part.

[31818] VGAM825 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM825 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[31819] VGAM825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM825 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM825 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31820] The complementary binding of VGAM825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM825 host target RNA into VGAM825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31821] It is appreciated that VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM825 host target genes. The mRNA of each one of this plurality of VGAM825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM825 RNA, herein designated VGAM RNA, and which when bound by VGAM825 RNA causes inhibition of translation of respective one or more VGAM825

host target proteins.

[31822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM825 gene, herein designated VGAM GENE, on one or more VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31823] It is yet further appreciated that a function of VGAM825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific

functions, and accordingly utilities, of VGAM825 correlate with, and may be deduced from, the identity of the host target genes which VGAM825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31824] Nucleotide sequences of the VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM825 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM825 are further described hereinbelow with reference to Table 1.

[31825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM825 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31826] As mentioned hereinabove with reference to Fig. 1, a function of VGAM825 gene, herein designated VGAM is inhibition of expression of VGAM825 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM825 correlate with, and may be deduced from, the identity of the target genes which VGAM825 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31827] Integrin, Alpha 6 (ITGA6, Accession NM\_000210) is a VGAM825 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5702, to the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31828] A function of VGAM825 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM\_000210). Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. Mitogen-activated Protein Kinase 3 (MAPK3, Accession XM\_055766) is another VGAM825 host target gene. MAPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK3 BINDING SITE, designated SEQ ID:36322, to the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31829] Another function of VGAM825 is therefore inhibition of Mitogen-activated Protein Kinase 3 (MAPK3, Accession XM\_055766), a gene which phosphorylates microtubule-associated protein-2, myelin basic protein, and elk-1; may promote entry into the cell cycle. Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK3. The function of MAPK3 has been established by previous studies. Experience-dependent plasticity in the developing visual cortex depends on electrical activity and molecular signals involved in stabilization or removal of inputs. ERK1 and ERK2 (MAPK1) activation in the cortex is regulated by both factors. Di Cristo et al. (2001) demonstrated that 2 different inhibitors of the ERK pathway suppress the induction of 2 forms of long-term potentiation in rat cortical slices and that their intracortical administration to monocularly deprived rats prevents the shift in ocular

dominance towards the nondeprived eye. Di Cristo et al. (2001) concluded that the ERK pathway is necessary for experience-dependent plasticity and for long-term potentiation of synaptic transmission in the developing visual cortex. Forcet et al. (2002) showed that in embryonic kidney cells expressing full-length, but not cytoplasmic domain-truncated, DCC (OMIM Ref. No. 120470), NTN1 (OMIM Ref. No. 601614) causes increased transient phosphorylation and activity of ERK1 and ERK2 (OMIM Ref. No. 176948), but not of JNK1 (OMIM Ref. No. 601158), JNK2 (OMIM Ref. No. 602896), or p38 (MAPK14; 600289). This phosphorylation was mediated by MEK1 (MAP2K1; 176872) and/or MEK2 (MAP2K2; 601263). NTN1 also activated the transcription factor ELK1 (OMIM Ref. No. 311040) and serum response element-regulated gene expression. Immunoprecipitation analysis showed interaction of full-length DCC with MEK1/2 in the presence or absence of NTN1. Forcet et al. (2002) showed that activation of Dcc by Ntn1 in rat embryonic day-13 dorsal spinal cord stimulates and is required for the outgrowth of commissural axons and Erk1/2 activation. Immunohistochemical analysis demonstrated expression of activated Erk1/2 in embryonic commissural axons, and this expression was

diminished in Dcc or Ntn1 knockout animals. Forcet et al. (2002) concluded that the MAPK pathway is involved in responses to NTN1 and proposed that ERK activation affects axonal growth by phosphorylation of microtubule-associated proteins and neurofilaments. Animal model experiments lend further support to the function of MAPK3. Pages et al. (1999) generated p44 Mapk (Erk1)-deficient mice by homologous recombination in embryonic stem cells. The p44 Mapk were viable, fertile, and of normal size. Thus, Pages et al. (1999) concluded that p44 Mapk is apparently dispensable and that p42 Mapk (Erk2) may compensate for its loss. However, in p44 Mapk  $-/-$  mice, thymocyte maturation beyond the CD4<sup>+</sup>CD8<sup>+</sup> stage was reduced by half, with a similar diminution in the thymocyte subpopulation expressing high levels of T cell receptor (CD3-high). In p44 Mapk  $-/-$  thymocytes, proliferation in response to activation with a monoclonal antibody to the T cell receptor in the presence of phorbol myristate acetate was severely reduced even though activation of p42 Mapk was more sustained in these cells. Thus, Pages et al. (1999) concluded that p44 Mapk apparently has a specific role in thymocyte development.

[31830] It is appreciated that the abovementioned animal model

for MAPK3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[31831] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31832] Pages, G.; Guerin, S.; Grall, D.; Bonino, F.; Smith, A.; Anjuere, F.; Auberger, P.; Pouyssegur, J. : Defective thymocyte maturation in p44 MAP kinase (Erk 1) knockout mice. Science 286: 1374–1378, 1999. ; and

[31833] Forcet, C.; Stein, E.; Pays, L.; Corset, V.; Llambi, F.; Tessier-Lavigne, M.; Mehlen, P. : Netrin-1-mediated axon outgrowth requires deleted in colorectal cancer-dependent MAPK activation.

[31834] Further studies establishing the function and utilities of MAPK3 are found in John Hopkins OMIM database record ID 601795, and in cited publications numbered 5785–1533, 6235, 623 and 6237 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ12903 (Accession NM\_022753) is another VGAM825 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12903, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22982, to the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31835] Another function of VGAM825 is therefore inhibition of FLJ12903 (Accession NM\_022753). Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. UCH37 (Accession NM\_015984) is another VGAM825 host target gene. UCH37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCH37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCH37 BINDING SITE, designated SEQ ID:18080, to the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31836] Another function of VGAM825 is therefore inhibition of UCH37 (Accession NM\_015984). Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with UCH37. LOC132321 (Accession XM\_059585) is another VGAM825 host target gene. LOC132321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132321 BINDING SITE, designated SEQ ID:37026, to the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31837] Another function of VGAM825 is therefore inhibition of LOC132321 (Accession XM\_059585). Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132321. LOC222066 (Accession XM\_166582) is another VGAM825 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:44554, to

the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, also designated SEQ ID:3536.

[31838] Another function of VGAM825 is therefore inhibition of LOC222066 (Accession XM\_166582). Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 826 (VGAM826) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31839] VGAM826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM826 was detected is described hereinabove with reference to Figs. 1–8.

[31840] VGAM826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31841] VGAM826 gene encodes a VGAM826 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM826 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM826 precursor RNA is designated SEQ ID:812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:812 is located at position 92205 relative to the genome of Bovine Herpesvirus 4.

[31842] VGAM826 precursor RNA folds onto itself, forming VGAM826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31843] An enzyme complex designated DICER COMPLEX, `dices` the VGAM826 folded precursor RNA into VGAM826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM826 RNA is designated SEQ ID:3537, and is provided hereinbelow with reference to the sequence listing part.

[31844] VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM826 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[31845] VGAM826 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM826 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31846] The complementary binding of VGAM826 RNA, herein designated VGAM RNA, to host target binding sites on VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM826 host target RNA into VGAM826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31847] It is appreciated that VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM826 host target genes. The mRNA of each one of this plurality of VGAM826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM826 RNA, herein designated VGAM RNA, and which when bound by VGAM826 RNA causes inhibition of translation of respective one or more VGAM826 host target proteins.

[31848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM826 gene, herein designated VGAM GENE, on one or more VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[31849] It is yet further appreciated that a function of VGAM826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM826 correlate with, and may be deduced from, the identity of the host target genes which VGAM826 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31850] Nucleotide sequences of the VGAM826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM826 are further described hereinbelow with reference to Table 1.

[31851] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM826 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31852] As mentioned hereinabove with reference to Fig. 1, a function of VGAM826 gene, herein designated VGAM is inhibition of expression of VGAM826 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM826 correlate with, and may be deduced from, the identity of the target genes which VGAM826 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31853] Dihydrofolate Reductase (DHFR, Accession NM\_000791) is a VGAM826 host target gene. DHFR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:6447, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31854] A function of VGAM826 is therefore inhibition of Dihydrofolate Reductase (DHFR, Accession NM\_000791), a gene

which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR. The function of DHFR has been established by previous studies. Dihydrofolate reductase (EC 1.5.1.3) converts dihydrofolate into tetrahydrofolate, a methyl group shuttle required for the de novo synthesis of purines, thymidylic acid, and certain amino acids. DHFR is inhibited by methotrexate (MTX), a folate analog used as an antineoplastic and immunosuppressive agent. From comparisons of eukaryotic gene sequences and protein sequences of homologous enzymes from bacterial and mammalian organisms, Craik et al. (1983) noted that intron-exon junctions often coincide with variable surface loops of the protein structure. Proteins studied included DHFR, trypsin, and chymotrypsin. They pointed out that altered surface structures can account for functional differences among the members of a family, e.g., the serine proteases. 'Sliding' of the intron-exon junctions may constitute a mechanism for generating length polymorphisms and divergent sequences. Different function can thus be achieved without disrupting the stability of the protein core. DNA sequence amplification is one of the most fre-

quent manifestations of genomic instability in human tumors. In most human tumor cells, amplified DNA sequences are borne on unstable, extrachromosomal double minutes (DMs). Singer et al. (2000) isolated a large number of independent methotrexate-resistant human cell lines, all of which contained DHFR-bearing DMs. All but one of these also had suffered partial or complete loss of one of the parental DHFR-bearing chromosomes. Cells in a few populations displayed what could be transient intermediates in the amplification process, including an initial homogeneously staining chromosome region (HSR), its subsequent breakage, the appearance of DHFR-containing fragments, and, finally, DMs. The studies suggested that both HSRs and DMs are initiated by chromosome breaks, but that cell types differ in how the extra sequences ultimately are processed and/or maintained.

[31855] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31856] Singer, M. J.; Mesner, L. D.; Friedman, C. L.; Trask, B. J.; Hamlin, J. L. : Amplification of the human dihydrofolate reductase gene via double minutes is initiated by chromosome breaks. Proc. Nat. Acad. Sci. 97: 7921–7926, 2000. ;

and

[31857] Craik, C. S.; Rutter, W. J.; Fletterick, R. : Splice junctions: association with variation in protein structure. Science 220: 1125–1129, 1983.

[31858] Further studies establishing the function and utilities of DHFR are found in John Hopkins OMIM database record ID 126060, and in cited publications numbered 3985–4002 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heat Shock 70kDa Protein 1B (HSPA1B, Accession NM\_005346) is another VGAM826 host target gene. HSPA1B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPA1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA1B BINDING SITE, designated SEQ ID:11819, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31859] Another function of VGAM826 is therefore inhibition of Heat Shock 70kDa Protein 1B (HSPA1B, Accession NM\_005346), a gene which stabilizes preexistent proteins against aggregation and mediate the folding of newly

translated polypeptides in the cytosol as well as within organelles. Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA1B. The function of HSPA1B has been established by previous studies. Heat-shock proteins, or stress proteins, are expressed in response to heat shock and a variety of other stress stimuli including oxidative free radicals and toxic metal ions. The human HSP70, or HSPA, multigene family encodes several highly conserved 70-kD proteins with structural and functional properties in common, but which vary in their inducibility in response to metabolic stress. Sargent et al. (1989) identified a duplicated HSP70 locus in the class III region of the major histocompatibility complex on 6p21.3. These loci, HSP70-1 (HSPA1A; 140550) and HSP70-2 (OMIM Ref. No. HSPA1B), are 12 kb apart and lie 92 kb telomeric to the C2 gene (see OMIM Ref. No. 217000). Milner and Campbell (1990) determined that the HSP70-2 gene, like HSP70-1, lacks introns. The HSP70-1 and -2 coding sequences, which differ by 8 bp that do not alter the derived amino acid sequence, encode identical 641-amino acid proteins; the 3-prime untranslated regions of these genes are completely divergent. Northern

blot analysis of HeLa cell RNA detected an approximately 2.4-kb HSP70-2 transcript that was expressed at elevated levels following heat shock. Milner and Campbell (1992) investigated the presence of sequence variation in the HSP70-2 gene among different HLA haplotypes. They found only very limited sequence variation, which did not result in amino acid substitutions.

[31860] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31861] Milner, C. M.; Campbell, R. D. : Structure and expression of the three MHC-linked HSP70 genes. Immunogenetics 32: 242-251, 1990. ; and

[31862] Milner, C. M.; Campbell, R. D. : Polymorphic analysis of the three MHC-linked HSP70 genes. Immunogenetics 36: 357-362, 1992.

[31863] Further studies establishing the function and utilities of HSPA1B are found in John Hopkins OMIM database record ID 603012, and in cited publications numbered 1161 and 11611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865)

is another VGAM826 host target gene. PIK3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R1 BINDING SITE, designated SEQ ID:34040, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31864] Another function of VGAM826 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865), a gene which acts as an adapter, for the insulin-stimulated increase in glucose uptake and glycogen synthesis. Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R1. The function of PIK3R1 has been established by previous studies. Phosphatidylinositol 3-kinase (PIK3) activity is implicated in diverse cellular responses triggered by mammalian cell surface receptors. Stoyanov et al. (1995) noted that receptors with tyrosine kinase activity recruit heterodimeric PIK3 kinases composed of a p110 catalytic subunit and a p85 adaptor subunit (OMIM

Ref. No. 171833). Stoyanov et al. (1995) screened a human bone marrow cDNA library with primers based on the sequences of yeast and bovine PIK3 p110 subunits. They isolated a human cDNA for a novel p110 subunit, which they termed p110-gamma. The cDNA encodes a predicted 120-kD, 1,050-amino acid polypeptide with 36% identity to human p110-alpha (OMIM Ref. No. 171834). The 5.3-kb p110-alpha transcript was detectable by Northern blot in human pancreas, skeletal muscle, liver, and heart. Stoyanov et al. (1995) found that recombinant p110-gamma did not interact with the p85 subunit in vivo, in contrast to recombinant p110-alpha. The transducin G protein subunits G-beta(t) (OMIM Ref. No. 189974)/G-gamma(t) (OMIM Ref. No. 189970) did, however, activate p110-gamma in vitro, and the stimulation was suppressed by G-alpha(t)-GDP (OMIM Ref. No. 139330); G-alpha(t)-GDP could stimulate p110-gamma only in the presence of AlF(4-). In contrast, the p85-dependent p110-alpha was not similarly affected by the G protein subunits. Stoyanov et al. (1995) speculated that the p110-gamma isotype may link signaling through G protein-coupled receptors and generate phosphoinositide second messengers phosphorylated in the D-3 posi-

tion Animal model experiments lend further support to the function of PI3K. Phosphoinositide 3-kinase (PI3K) activation is implicated in many responses, including fibroblast growth, transformation, survival, and chemotaxis. Although PI3K is activated by several agents that stimulate T and B cells, the role of PI3K in lymphocyte function remained to be clarified. Fruman et al. (1999) disrupted the mouse gene encoding the PI3K adaptor subunit p85- $\alpha$  and its splice variants p55- $\alpha$  and p50- $\alpha$ . Most mice homozygous for disruption for all 3 variants died within days after birth. Lymphocyte development and function were studied with the use of the RAG2-deficient blastocyst complementation system. Chimeric mice had reduced numbers of peripheral mature B cells and decreased serum immunoglobulin. The B cells that developed had diminished proliferative responses to antibody to immunoglobulin M, antibody to CD40, and lipopolysaccharide stimulation, as well as decreased survival after incubation with interleukin-4. In contrast, T-cell development and proliferation were normal. This phenotype was similar to defects observed in mice lacking the tyrosine kinase Btk and in patients with Bruton X-linked agammaglobulinemia (300300

[31865] It is appreciated that the abovementioned animal model for PIK3R1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[31866] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31867] Fruman, D. A.; Snapper, S. B.; Yballe, C. M.; Davidson, L.; Yu, J. Y.; Alt, F. W.; Cantley, L. C. : Impaired B cell development and proliferation in absence of phosphoinositide 3-kinase p85-alpha. Science 283: 393-397, 1999. ; and

[31868] Simoncini, T.; Hafezi-Moghadam, A.; Brazil, D. P.; Ley, K.; Chin, W. W.; Liao, J. K. : Interaction of oestrogen receptor with the regulatory subunit of phosphatidylinositol-3-OH kinase. N.

[31869] Further studies establishing the function and utilities of PIK3R1 are found in John Hopkins OMIM database record ID 171833, and in cited publications numbered 3521-3522, 3834-3837, 1085 and 3839-3842 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136) is another VGAM826 host target gene. ZNF80 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF80 BINDING SITE, designated SEQ ID:13986, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31870] Another function of VGAM826 is therefore inhibition of Zinc Finger Protein 80 (pT17) (ZNF80, Accession NM\_007136). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF80. KIAA0562 (Accession NM\_014704) is another VGAM826 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16244, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31871] Another function of VGAM826 is therefore inhibition of KIAA0562 (Accession NM\_014704). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. KIAA1219 (Accession XM\_028835) is another VGAM826 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30761, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31872] Another function of VGAM826 is therefore inhibition of KIAA1219 (Accession XM\_028835). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. Organic Cationic Transporter-like 3 (ORCTL3, Accession NM\_004256) is another VGAM826 host target gene. ORCTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORCTL3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORCTL3 BINDING SITE, designated SEQ ID:10443, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31873] Another function of VGAM826 is therefore inhibition of Organic Cationic Transporter-like 3 (ORCTL3, Accession NM\_004256). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORCTL3. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM826 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16079, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31874] Another function of VGAM826 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654).

Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. LOC115219 (Accession XM\_055499) is another VGAM826 host target gene.

LOC115219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36276, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31875] Another function of VGAM826 is therefore inhibition of LOC115219 (Accession XM\_055499). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219. LOC223073 (Accession XM\_170293) is another VGAM826 host target gene. LOC223073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC223073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC223073 BINDING SITE, designated SEQ ID:45317, to the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, also designated SEQ ID:3537.

[31876] Another function of VGAM826 is therefore inhibition of LOC223073 (Accession XM\_170293). Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC223073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 827 (VGAM827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31877] VGAM827 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM827 was detected is described hereinabove with reference to Figs. 1–8.

[31878] VGAM827 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[31879] VGAM827 gene encodes a VGAM827 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM827 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM827 precursor RNA is designated SEQ ID:813, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:813 is located at position 90686 relative to the genome of Bovine Herpesvirus 4.

[31880] VGAM827 precursor RNA folds onto itself, forming VGAM827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM827 folded precursor RNA into VGAM827 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM827 RNA is designated SEQ ID:3538, and is provided hereinbelow with reference to the sequence listing part.

[31882] VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM827 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[31883] VGAM827 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM827 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31884] The complementary binding of VGAM827 RNA, herein designated VGAM RNA, to host target binding sites on VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM827 host target RNA into VGAM827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31885] It is appreciated that VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM827 host target genes. The mRNA of each one of this plurality of VGAM827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM827 RNA, herein designated VGAM RNA, and which when bound by VGAM827 RNA causes inhibition of translation of respective one or more VGAM827 host target proteins.

[31886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM827 gene, herein designated VGAM GENE, on one or more VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31887] It is yet further appreciated that a function of VGAM827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM827 correlate with, and may be deduced from, the identity of the host target genes which VGAM827 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31888] Nucleotide sequences of the VGAM827 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM827 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM827 are further described hereinbelow with reference to Table 1.

[31889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM827 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM827 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[31890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM827 gene, herein designated VGAM is inhibition of expression of VGAM827 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM827 correlate with, and may be deduced from, the identity of the target genes which VGAM827 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31891] ATPase, H<sup>+</sup> Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM\_001690) is a VGAM827 host target gene. ATP6V1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:7412, to the nucleotide sequence of VGAM827 RNA, herein designated

VGAM RNA, also designated SEQ ID:3538.

[31892] A function of VGAM827 is therefore inhibition of ATPase, H<sup>+</sup> Transporting, Lysosomal 70kDa, V1 Subunit A, Iso-form 1 (ATP6V1A1, Accession NM\_001690), a gene which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A1. The function of ATP6V1A1 has been established by previous studies. Van Hille et al. (1993) cloned a partial cDNA clone for an A subunit isoform, which they designated VA68, from a human osteoclastoma tumor cDNA library by PCR using degenerate primers based on the bovine sequence. They obtained a full-length clone from a genomic library. The deduced 617-amino acid protein has a predicted molecular mass of about 68 kD and shows 99% sequence identity with the bovine brain subunit A. Northern blot analysis revealed ubiquitous expression of a major 4.8-kb band and a minor 3.4-kb band. They also identified a variant, which they designated HO68, encoding a 615-amino acid protein. By RNase protection assays and in situ hybridization, van Hille et al. (1995) determined that expression of the HO68

variant was specific to the osteoclastoma originally used to construct the cDNA library.

[31893] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31894] van Hille, B.; Richener, H.; Evans, D. B.; Green, J. R.; Bilbe, G. : Identification of two subunit A isoforms of the vacuolar H(+)-ATPase in human osteoclastoma. J. Biol. Chem. 268: 7075-7080, 1993. ; and

[31895] van Hille, B.; Richener, H.; Green, J. R.; Bilbe, G. : The ubiquitous VA68 isoform of subunit A of the vacuolar H(+)-ATPase is highly expressed in human osteoclasts. Biochem. Biophys.

[31896] Further studies establishing the function and utilities of ATP6V1A1 are found in John Hopkins OMIM database record ID 607027, and in cited publications numbered 5382-5383 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_130436) is another VGAM827 host target gene. DYRK1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYRK1A, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28192, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31897] Another function of VGAM827 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_130436), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM\_001247) is another VGAM827 host target gene. ENTPD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENTPD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ENTPD6 BINDING SITE, designated SEQ ID:6920, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31898] Another function of VGAM827 is therefore inhibition of Ectonucleoside Triphosphate Diphosphohydrolase 6 (putative function) (ENTPD6, Accession NM\_001247), a gene which might support glycosylation reactions in the golgi apparatus and, when released from cells, might catalyze the hydrolysis of extracellular nucleotides. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENTPD6. The function of ENTPD6 has been established by previous studies. Extracellular nucleotides serve as signaling molecules in many extracellular activities. The catabolism of extracellular nucleotides is mediated by several types of ectonucleotidases, including the divalent cation-dependent E-type nucleotidases (NTPases). The E-type NTPases include ectoapyrases, such as CD39 (OMIM Ref. No. 601752), which show a significant rate of ADP hydrolysis compared to ATP hydrolysis. NTPases are characterized by the presence of 4 motifs

known as apyrase-conserved regions (ACRs). Chadwick et al. (1998) identified cDNAs encoding a mouse NTPase, symbolized MNTPase. By searching an EST database for sequences similar to that of MNTPase, Chadwick and Frischauf (1998) identified cDNAs corresponding to 2 human genes, CD39L2 and CD39L4 (OMIM Ref. No. 603162). The predicted 484-amino acid CD39L2 protein contains all 4 ACRs, a single N-terminal transmembrane segment, and a large extracellular C-terminal domain. Northern blot analysis revealed that CD39L2 was expressed as a major 2.6-kb and minor 4.4-kb mRNA in all tissues tested. Homology searches yielded ESTs likely to represent the mouse *cd39l2* gene. By PCR and sequence analysis of cDNA libraries, and by Northern blot analysis, Yeung et al. (2000) detected CD39L2 predominantly in heart, with very low or no expression in other tissues. In situ hybridization analysis revealed expression distinctively in cardiac muscle and capillary endothelial cells. A larger variant, resulting from a 43-bp insertion in exon 14, was detected in fetal brain. Western blot analysis of cells expressing recombinant CD39L2 detected expression of an approximately 60-kD protein triplet primarily in the secreted fraction but also on membranes. Glycosidase treatment

reduced the size of the protein to 57 kD, still greater than the predicted 53 kD, suggesting additional posttranslational modifications. Brefeldin A treatment decreased the secretion of CD39L2. Flow cytometric analysis demonstrated expression on the extracellular membrane. Functional analysis showed that, like CD39L4, CD39L2 preferentially hydrolyzes nucleotide diphosphates rather than triphosphates. This hydrolysis is enhanced in the presence of magnesium or calcium. However, in contrast to CD39, calcium excess fails to inhibit CD39L2-mediated adenosine diphosphatase activity. On the basis of structural and biochemical features, Yeung et al. (2000) concluded that CD39L2 and CD39L4 are in a separate subclass, defined by the presence of only 1 N-terminal hydrophobic transmembrane domain, from CD39, CD39L1 (OMIM Ref. No. 602012), and CD39L3 (OMIM Ref. No. 603161), which have an N-terminal and a C-terminal transmembrane domain. By analysis of radiation hybrid and somatic cell hybrid panels, Chadwick and Frischauf (1998) mapped the CD39L2 gene to 20q11.2.

[31899] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [31900] Chadwick, B. P.; Williamson, J.; Sheer, D.; Frischauf, A.-M. : cDNA cloning and chromosomal mapping of a mouse gene with homology to NTPases. *Mammalian Genome* 9: 162–164, 1998. ; and
- [31901] Yeung, G.; Mulero, J. J.; McGowan, D. W.; Bajwa, S. S.; Ford, J. E. : CD39L2, a gene encoding a human nucleoside diphosphatase, predominantly expressed in the heart. *Biochemistry* 39: 12.
- [31902] Further studies establishing the function and utilities of ENTPD6 are found in John Hopkins OMIM database record ID 603160, and in cited publications numbered 6232–2429 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 1 (FLRT1, Accession XM\_006111) is another VGAM827 host target gene. FLRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT1 BINDING SITE, designated SEQ ID:29992, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ

ID:3538.

[31903] Another function of VGAM827 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 1 (FLRT1, Accession XM\_006111). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT1. Glycoprotein M6A (GPM6A, Accession NM\_005277) is another VGAM827 host target gene. GPM6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPM6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ ID:11782, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31904] Another function of VGAM827 is therefore inhibition of Glycoprotein M6A (GPM6A, Accession NM\_005277), a gene which may play a role in neuronal development. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A. The function of GPM6A and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM326. Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM\_002203) is another VGAM827 host target gene. ITGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA2 BINDING SITE, designated SEQ ID:7963, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31905] Another function of VGAM827 is therefore inhibition of Integrin, Alpha 2 (CD49B, alpha 2 subunit of VLA-2 receptor) (ITGA2, Accession NM\_002203), a gene which has roles in blood clotting and angiogenesis, acts as a collagen and laminin receptor. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA2. The function of ITGA2 has been established by previous studies. By screening a uterus cDNA library with an integrin-like cDNA fragment isolated from a fetal myoblast

cDNA library, Velling et al. (1999) obtained a full-length cDNA sequence encoding integrin alpha-11. ITGA11 encodes a deduced 1,188-amino acid protein, including a 22-amino acid signal peptide. The mature 1,166-amino acid protein contains a 23-amino acid transmembrane region and a 24-amino acid cytoplasmic tail. It differs from most other integrin alpha chains in that the cytoplasmic tail contains the sequence GFFRS instead of the conserved GFFKR sequence. The extracellular domain contains 7 FG-GAP repeats with an I domain of 195 amino acids between repeats 2 and 3 that includes a conserved metal ion-dependent adhesion site motif. Twenty cysteines are located in the extracellular domain and there are 16 potential N-glycosylation sites. ITGA11 is 42%, 37%, and 35% identical with I domain alpha-integrins ITGA10 (OMIM Ref. No. 604042), ITGA1 (OMIM Ref. No. 192968), and ITGA2 (OMIM Ref. No. 192974), respectively. Northern blot analysis revealed expression of an approximately 5.5-kb ITGA11 transcript. Expression was highest in uterus, strong in heart, intermediate in skeletal muscle, stomach, small intestine, bladder, prostate, and colon, and low in nonmuscle tissues such as pancreas, kidney, and placenta. The authors found that, in contrast, ITGA1 is not

expressed in the uterus. Immunoprecipitation studies and SDS-PAGE analysis showed that ITGA11 encodes a 145-kD protein, intermediate in size between ITGA2 or ITGA10 and ITGA1; the authors suggested that the difference is probably due to differential glycosylation. Like other I domain-containing integrins, ITGA11 binds to collagen. By sequence analysis, Lehnert et al. (1999) found that the deduced ITGA11 protein contains an I domain of 207 amino acids and 15 N-glycosylation sites in a mature protein of 1167 amino acids. By FISH, Velling et al. (1999) mapped the ITGA11 gene to chromosome 15q23. By somatic cell hybrid analysis and FISH, Lehnert et al. (1999) mapped the gene to 15q22.3-q23.

[31906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31907] Lehnert, K.; Ni, J.; Leung, E.; Gough, S. M.; Weaver, A.; Yao, W.-P.; Liu, D.; Wang, S.-X.; Morris, C. M.; Krissansen, G. W. : Cloning, sequence analysis, and chromosomal localization of the novel human integrin alpha-11 subunit (ITGA11). *Genomics* 60: 179-187, 1999. ; and

[31908] Velling, T.; Kusche-Gullberg, M.; Sejersen, T.; Gullberg, D. : cDNA cloning and chromosomal localization of human

alpha-11 integrin: a collagen-binding, I domain-containing, beta-1-asso.

[31909] Further studies establishing the function and utilities of ITGA2 are found in John Hopkins OMIM database record ID 192974, and in cited publications numbered 6052-6053, 6381, 10003-1001 and 3351 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924) is another VGAM827 host target gene. MEOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEOX2 BINDING SITE, designated SEQ ID:12551, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31910] Another function of VGAM827 is therefore inhibition of Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924), a gene which roles in mesoderm induction and, somitogenesis, and myogenic

and sclerotomal differentiation. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEOX2. The function of MEOX2 has been established by previous studies. Candia et al. (1992) and Gorski et al. (1993) isolated and studied the murine Mox2 gene, which belongs to a family of nonclustered, diverged homeo box genes. In situ hybridization analysis during murine embryogenesis indicated that the Mox2 gene is expressed in a wide range of mesodermal structures, including somites and vertebrae, the developing limbs, groups of muscles of the head, and the developing palate. These findings suggested that mutations in the human homolog of the Mox2 gene may be involved in craniofacial and/or skeletal abnormalities in the human. They isolated and characterized cDNA clones for the human homolog, which they termed MOX2, and found that it contains all of the characteristic features of Mox2 proteins of other vertebrate species, namely the homeo box, the polyhistidine stretch, and a number of potential serine/threonine phosphorylation sites. The homeodomain of the Mox2 protein is identical to that in all other vertebrate species studied to that time (rodents and amphibians). By fluorescence in situ hy-

bridization, Grigoriou et al. (1995) mapped the human MEOX2 gene to 7p22.1–p21.3. This is the region where the Saethre–Chotzen syndrome (OMIM Ref. No. 101400) maps, thus it became a candidate for the site of the mutation in that disorder. Mankoo et al. (1999) generated mice homozygous for a null mutation of Mox2 by targeted disruption. Mox2  $-/-$  mice have a developmental defect of the limb musculature characterized by an overall reduction in muscle mass and elimination of specific muscles. Mox2 is not needed for the migration of myogenic precursors into the limb bud, but it is essential for normal appendicular muscle formation and for the normal regulation of myogenic genes, as demonstrated by the down-regulation of Pax3 (OMIM Ref. No. 600535) and Myf5 (OMIM Ref. No. 159990) but not MyoD (OMIM Ref. No. 159970) in Mox2-deficient limb buds. Mankoo et al. (1999) concluded that MOX2 homeoprotein is an important regulator of vertebrate limb myogenesis.

[31911] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31912] Candia, A. F.; Hu, J.; Crosby, J.; Lalley, P. A.; Noden, D.; Nadeau, J. H.; Wright, C. V. E. : Mox–1 and Mox–2 define a

novel homeobox gene subfamily and are differentially expressed during early mesodermal patterning in mouse embryos. Development 116: 1123–1136, 1992. ; and

[31913] Mankoo, B. S.; Collins, N. S.; Ashby, P.; Grigorieva, E.; Pevny, L. H.; Candia, A.; Wright, C. V. E.; Rigby, P. W. J.; Pachnis, V. : Mox2 is a component of the genetic hierarchy contro.

[31914] Further studies establishing the function and utilities of MEOX2 are found in John Hopkins OMIM database record ID 600535, and in cited publications numbered 7679–7683 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurocalcin Delta (NCALD, Accession NM\_032041) is another VGAM827 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25749, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31915] Another function of VGAM827 is therefore inhibition of

Neurocalcin Delta (NCALD, Accession NM\_032041). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM827 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10412, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31916] Another function of VGAM827 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982) is another VGAM827 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30610, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31917] Another function of VGAM827 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. RAB3B, Member RAS Oncogene Family (RAB3B, Accession NM\_002867) is another VGAM827 host target gene. RAB3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3B BINDING SITE, designated SEQ ID:8772, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31918] Another function of VGAM827 is therefore inhibition of RAB3B, Member RAS Oncogene Family (RAB3B, Accession NM\_002867). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3B. Ring Finger Protein 14 (RNF14, Accession NM\_004290) is another VGAM827 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE, designated SEQ ID:10506, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31919] Another function of VGAM827 is therefore inhibition of Ring Finger Protein 14 (RNF14, Accession NM\_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 has been established by previous studies. The RING finger motif is a unique

zinc–chelating domain involved in mediating protein–DNA and protein–protein interactions. Using the sequence of the partial cDNA clone HFB30 isolated by Ueki et al.

(1998) to screen a human fetal brain cDNA library, Ueki et al. (1999) cloned the full–length cDNA, which encoded a novel ring finger protein, RNF14. The deduced 474–amino acid protein has a calculated molecular mass of approximately 53 kD. RT–PCR analysis revealed ubiquitous expression of RNF14 in a wide variety of human tissues.

Kang et al. (1999) independently cloned RNF14, which they called ARA54 (androgen receptor–associated protein–54), by a yeast 2–hybrid screen of a prostate cDNA library. Northern blot analysis detected a major 3–kb transcript, with highest expression in testis, followed by thymus, spleen, colon, prostate, and uterus. Low expression was detected in small intestine and blood leukocytes. The RNF14 transcript was also strongly detected in 2 other prostate cell lines. A second transcript of 2 kb was detected in testis only. Kang et al. (1999) demonstrated that RNF14 can function as a coactivator for androgen–dependent transcription on both wildtype and mutant androgen receptor (OMIM Ref. No. 313700). They also showed that in the presence of a certain amount of

17-beta-estradiol or hydroxyflutamide, the transcriptional activity of a specific AR mutant was significantly enhanced, whereas that of wildtype and another AR mutant was not. The authors suggested that both RNF14 and the positions of the AR mutation might contribute to the specificity of AR-mediated transactivation. Ueki et al. (1999) determined that the RNF14 gene contains 9 exons and spans approximately 20 kb of genomic DNA. By somatic cell hybrid and radiation hybrid analyses, Ueki et al. (1999) mapped the RNF14 gene to chromosome 5q23.3-q31.1.

[31920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31921] Ueki, N.; Seki, N.; Yano, K.; Masuho, Y.; Saito, T.; Muramatsu, M. : Isolation and characterization of a novel human gene (HFB30) which encodes a protein with a RING finger motif. *Biochim. Biophys. Acta* 232-236, 1999. ; and

[31922] Kang, H.-Y.; Yeh, S.; Fujimoto, N.; Chang, C. : Cloning and characterization of human prostate coactivator ARA54, a novel protein that associates with the androgen receptor. *J. Biol. Chem.*

[31923] Further studies establishing the function and utilities of

RNF14 are found in John Hopkins OMIM database record ID 605675, and in cited publications numbered 8810–967 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060) is another VGAM827 host target gene. SLC22A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC22A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A5 BINDING SITE, designated SEQ ID:9029, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31924] Another function of VGAM827 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A5. Syntaxin 7 (STX7, Accession NM\_003569) is another VGAM827 host target gene. STX7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by STX7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX7 BINDING SITE, designated SEQ ID:9625, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31925] Another function of VGAM827 is therefore inhibition of Syntaxin 7 (STX7, Accession NM\_003569). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX7. Surfeit 6 (SURF6, Accession NM\_006753) is another VGAM827 host target gene. SURF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SURF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF6 BINDING SITE, designated SEQ ID:13610, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31926] Another function of VGAM827 is therefore inhibition of Surfeit 6 (SURF6, Accession NM\_006753). Accordingly,

utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF6. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185) is another VGAM827 host target gene. ARHGEF9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17539, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31927] Another function of VGAM827 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259) is another VGAM827 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33042, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31928] Another function of VGAM827 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ14153 (Accession NM\_022736) is another VGAM827 host target gene. FLJ14153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14153 BINDING SITE, designated SEQ ID:22942, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31929] Another function of VGAM827 is therefore inhibition of FLJ14153 (Accession NM\_022736). Accordingly, utilities of

VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14153. FLJ22127 (Accession NM\_022775) is another VGAM827 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:23044, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31930] Another function of VGAM827 is therefore inhibition of FLJ22127 (Accession NM\_022775). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127. KIAA0276 (Accession XM\_048199) is another VGAM827 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE,

designated SEQ ID:35140, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31931] Another function of VGAM827 is therefore inhibition of KIAA0276 (Accession XM\_048199). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. KIAA0367 (Accession XM\_041018) is another VGAM827 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33427, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31932] Another function of VGAM827 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0494 (Accession NM\_014774) is another VGAM827 host target gene. KIAA0494 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16592, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31933] Another function of VGAM827 is therefore inhibition of KIAA0494 (Accession NM\_014774). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA1000 (Accession XM\_036988) is another VGAM827 host target gene. KIAA1000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1000 BINDING SITE, designated SEQ ID:32536, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31934] Another function of VGAM827 is therefore inhibition of

KIAA1000 (Accession XM\_036988). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1000. KIAA1155 (Accession XM\_030864) is another VGAM827 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31203, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31935] Another function of VGAM827 is therefore inhibition of KIAA1155 (Accession XM\_030864). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. KIAA1437 (Accession XM\_026998) is another VGAM827 host target gene. KIAA1437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1437 BINDING SITE, designated SEQ ID:30386, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31936] Another function of VGAM827 is therefore inhibition of KIAA1437 (Accession XM\_026998). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1437. KIAA1884 (Accession XM\_055539) is another VGAM827 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36299, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31937] Another function of VGAM827 is therefore inhibition of KIAA1884 (Accession XM\_055539). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. NX-17 (Accession NM\_020665) is another

VGAM827 host target gene. NX-17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NX-17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NX-17 BINDING SITE, designated SEQ ID:21836, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31938] Another function of VGAM827 is therefore inhibition of NX-17 (Accession NM\_020665). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NX-17. Platelet-activating Factor Acetylhydrolase 2, 40kDa (PAFAH2, Accession NM\_000437) is another VGAM827 host target gene. PAFAH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH2 BINDING SITE, designated SEQ ID:6022, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3538.

[31939] Another function of VGAM827 is therefore inhibition of Platelet-activating Factor Acetylhydrolase 2, 40kDa (PAFAH2, Accession NM\_000437). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH2. Placenta-specific 3 (PLAC3, Accession XM\_045115) is another VGAM827 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34369, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31940] Another function of VGAM827 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM\_045115). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. PRO2405 (Accession NM\_018627) is another VGAM827 host target gene. PRO2405 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by PRO2405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2405 BINDING SITE, designated SEQ ID:20700, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31941] Another function of VGAM827 is therefore inhibition of PRO2405 (Accession NM\_018627). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2405. Roundabout, Axon Guidance Receptor, Homolog 2 (Drosophila) (ROBO2, Accession XM\_031246) is another VGAM827 host target gene. ROBO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROBO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO2 BINDING SITE, designated SEQ ID:31318, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31942] Another function of VGAM827 is therefore inhibition of

Roundabout, Axon Guidance Receptor, Homolog 2 (Drosophila) (ROBO2, Accession XM\_031246). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO2. Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966) is another VGAM827 host target gene. SEMA5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA5A BINDING SITE, designated SEQ ID:10107, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31943] Another function of VGAM827 is therefore inhibition of Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with SEMA5A. LOC133688 (Accession XM\_059665) is another VGAM827 host target gene. LOC133688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133688 BINDING SITE, designated SEQ ID:37051, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31944] Another function of VGAM827 is therefore inhibition of LOC133688 (Accession XM\_059665). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133688. LOC145815 (Accession XM\_096874) is another VGAM827 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40608, to

the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31945] Another function of VGAM827 is therefore inhibition of LOC145815 (Accession XM\_096874). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC153338 (Accession XM\_098361) is another VGAM827 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41612, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31946] Another function of VGAM827 is therefore inhibition of LOC153338 (Accession XM\_098361). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC155032 (Accession XM\_098647) is another VGAM827 host target gene. LOC155032 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC155032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155032 BINDING SITE, designated SEQ ID:41749, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31947] Another function of VGAM827 is therefore inhibition of LOC155032 (Accession XM\_098647). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155032. LOC155376 (Accession XM\_088240) is another VGAM827 host target gene. LOC155376 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155376 BINDING SITE, designated SEQ ID:39564, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31948] Another function of VGAM827 is therefore inhibition of LOC155376 (Accession XM\_088240). Accordingly, utilities

of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155376. LOC158046 (Accession NM\_145283) is another VGAM827 host target gene. LOC158046 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158046 BINDING SITE, designated SEQ ID:29801, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31949] Another function of VGAM827 is therefore inhibition of LOC158046 (Accession NM\_145283). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158046. LOC196527 (Accession XM\_113743) is another VGAM827 host target gene. LOC196527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196527 BINDING SITE, designated SEQ ID:42403, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31950] Another function of VGAM827 is therefore inhibition of LOC196527 (Accession XM\_113743). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196527. LOC245728 (Accession XM\_165922) is another VGAM827 host target gene. LOC245728 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245728 BINDING SITE, designated SEQ ID:43803, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31951] Another function of VGAM827 is therefore inhibition of LOC245728 (Accession XM\_165922). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245728. LOC253532 (Accession XM\_171152) is another VGAM827 host target gene. LOC253532 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253532 BINDING SITE, designated SEQ ID:45950, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31952] Another function of VGAM827 is therefore inhibition of LOC253532 (Accession XM\_171152). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253532. LOC253613 (Accession XM\_171225) is another VGAM827 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46014, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31953] Another function of VGAM827 is therefore inhibition of

LOC253613 (Accession XM\_171225). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. LOC254337 (Accession XM\_172034) is another VGAM827 host target gene. LOC254337 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254337 BINDING SITE, designated SEQ ID:46066, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31954] Another function of VGAM827 is therefore inhibition of LOC254337 (Accession XM\_172034). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254337. LOC254875 (Accession XM\_171170) is another VGAM827 host target gene. LOC254875 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254875 BINDING SITE, designated SEQ ID:45954, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31955] Another function of VGAM827 is therefore inhibition of LOC254875 (Accession XM\_171170). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254875. LOC51141 (Accession XM\_043953) is another VGAM827 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34052, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31956] Another function of VGAM827 is therefore inhibition of LOC51141 (Accession XM\_043953). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. LOC90321 (Accession XM\_030896) is another

VGAM827 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:31213, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31957] Another function of VGAM827 is therefore inhibition of LOC90321 (Accession XM\_030896). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. LOC93349 (Accession NM\_138402) is another VGAM827 host target gene. LOC93349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:28770, to the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, also designated SEQ ID:3538.

[31958] Another function of VGAM827 is therefore inhibition of LOC93349 (Accession NM\_138402). Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 828 (VGAM828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[31959] VGAM828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM828 was detected is described hereinabove with reference to Figs. 1–8.

[31960] VGAM828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[31961] VGAM828 gene encodes a VGAM828 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM828

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM828 precursor RNA is designated SEQ ID:814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:814 is located at position 13516 relative to the genome of African Swine Fever Virus.

[31962] VGAM828 precursor RNA folds onto itself, forming VGAM828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[31963] An enzyme complex designated DICER COMPLEX, `dices` the VGAM828 folded precursor RNA into VGAM828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM828 RNA is designated SEQ ID:3539, and is provided hereinbelow with reference to the sequence listing part.

[31964] VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM828 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[31965] VGAM828 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM828 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[31966] The complementary binding of VGAM828 RNA, herein designated VGAM RNA, to host target binding sites on VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM828 host target RNA into VGAM828 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[31967] It is appreciated that VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM828 host target genes. The mRNA of each one of this plurality of VGAM828 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM828 RNA, herein designated VGAM RNA, and which when bound by VGAM828 RNA causes inhibition of translation of respective one or more VGAM828 host target proteins.

[31968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM828 gene, herein designated VGAM GENE, on one or more VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[31969] It is yet further appreciated that a function of VGAM828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM828 correlate with, and may be deduced from, the identity of the host target genes which VGAM828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[31970] Nucleotide sequences of the VGAM828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM828 are further described hereinbelow with reference to Table 1.

[31971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM828 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM828 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[31972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM828 gene, herein designated VGAM is inhibition of expression of VGAM828 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM828 correlate with, and may be deduced from, the identity of the target genes which VGAM828 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[31973] D12S2489E (Accession NM\_007360) is a VGAM828 host target gene. D12S2489E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D12S2489E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D12S2489E BINDING SITE, designated SEQ ID:14293, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31974] A function of VGAM828 is therefore inhibition of D12S2489E (Accession NM\_007360), a gene which interacts in the inhibition and activation of NK cells. Accordingly, utilities of VGAM828 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with D12S2489E. The function of D12S2489E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM156. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071) is another VGAM828 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15291, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31975] Another function of VGAM828 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM25. Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765) is another VGAM828 host target gene. PRPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS2 BINDING SITE, designated SEQ ID:8658, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31976] Another function of VGAM828 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765), a gene which generates the PRPP needed for initiation of purine biosynthesis. Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPS2. The function of PRPS2 has been established by previous studies. Five-phosphoribosyl 1-pyrophosphate (OMIM Ref. No. PPRibP), an essential substrate and a critical regulator in the purine, pyrimidine, and pyridine nucleotide production pathways, is synthe-

sized from MgATP and ribose 5-phosphate by the enzyme PPRibP synthetase (EC 2.7.6.1). By cDNA cloning, Taira et al. (1987) found 2 distinct PPRibP synthetase subunits, PRS I (PRPS1; 311850) and PRS II. By screening a testis library with a rat PRS II cDNA, Iizasa et al. (1989) isolated cDNAs encoding human PRS II. The predicted 318-amino acid protein shares 99% identity with rat PRS II. Northern blot analysis revealed that PRS II is expressed as a 2.7-kb mRNA in testis. By using a rat cDNA probe for PRPS1 and a human cDNA probe for PRPS2, Taira et al. (1989) showed in DNA from somatic cell hybrids and in spot-blot hybridization of flow-sorted chromosomes that whereas PRPS1 is on Xq21-qter, PRPS2 is on Xpter-q21. Furthermore, 2 PRPS1-related genes were identified on chromosomes 7 and 9. By a combination of in situ hybridization and study of human/rodent somatic cell hybrids, Becker et al. (1990) assigned the PRPS2 locus to Xp22.3-p22.2. Despite the striking homology in the cDNA sequence and deduced amino acid sequence, PRPS1 and PRPS2 are encoded by genes on opposite arms of the X chromosome. Wang et al. (1992) demonstrated that the PRPS2 gene is inactivated with lyonization but that it lies between 2 genes that escape inactivation, STS (OMIM Ref. No.

308100) distally and ZFX (OMIM Ref. No. 314980) proximally. The PRPS1 gene also undergoes X inactivation. Wang et al. (1992) commented that it was not known which of the 2 PRPS loci is altered in patients with inherited PRPS superactivity. The ZFX gene, which escapes X-inactivation, is bracketed proximally by the POLA gene (OMIM Ref. No. 312040) which, like PRPS2, undergoes inactivation. The A1S9T (OMIM Ref. No. 314370) locus in the proximal short arm and the RPS4X gene (OMIM Ref. No. 312760) in the proximal long arm are other loci that escape inactivation and are interspersed among genes that do undergo X-inactivation. Furthermore, the XIST gene (OMIM Ref. No. 314670), located at Xq13, is transcribed only from the inactive X chromosome

[31977] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[31978] Taira, M.; Kudoh, J.; Minoshima, S.; Iizasa, T.; Shimada, H.; Shimizu, Y.; Tatibana, M.; Shimizu, N. : Localization of human phosphoribosylpyrophosphate synthetase subunit I and II genes (PRPS1 and PRPS2) to different regions of the X chromosome and assignment of two PRPS1-related genes to autosomes. *Somat. Cell Molec. Genet.* 15: 29-37,

1989. ; and

[31979] Wang, J. C.; Passage, M. B.; Ellison, J.; Becker, M. A.; Yen, P. H.; Shapiro, L. J.; Mohandas, T. K. : Physical mapping of loci in the distal half of the short arm of the human X chromos.

[31980] Further studies establishing the function and utilities of PRPS2 are found in John Hopkins OMIM database record ID 311860, and in cited publications numbered 8345–1234 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sex Comb On Midleg-like 1 (Drosophila) (SCML1, Accession NM\_006746) is another VGAM828 host target gene. SCML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML1 BINDING SITE, designated SEQ ID:13594, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31981] Another function of VGAM828 is therefore inhibition of Sex Comb On Midleg-like 1 (Drosophila) (SCML1, Accession NM\_006746). Accordingly, utilities of VGAM828 in–

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML1. Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM\_005065) is another VGAM828 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:11504, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31982] Another function of VGAM828 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM\_005065), a gene which may play a role in notch signaling (by similarity). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM245. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068) is another VGAM828 host

target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11514, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31983] Another function of VGAM828 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM\_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696) is another VGAM828 host target gene. SPOCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SPOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:31459, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31984] Another function of VGAM828 is therefore inhibition of Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK. B1 (Accession NM\_014451) is another VGAM828 host target gene. B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B1 BINDING SITE, designated SEQ ID:15801, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31985] Another function of VGAM828 is therefore inhibition of B1

(Accession NM\_014451). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B1.

FLJ14281 (Accession NM\_024920) is another VGAM828 host target gene. FLJ14281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14281 BINDING SITE, designated SEQ ID:24453, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31986] Another function of VGAM828 is therefore inhibition of FLJ14281 (Accession NM\_024920). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14281. HSPC019 (Accession NM\_014028) is another VGAM828 host target gene. HSPC019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HSPC019 BINDING SITE, designated SEQ ID:15254, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31987] Another function of VGAM828 is therefore inhibition of HSPC019 (Accession NM\_014028). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC019. KIAA0296 (Accession NM\_014699) is another VGAM828 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16224, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31988] Another function of VGAM828 is therefore inhibition of KIAA0296 (Accession NM\_014699). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0453 (Accession XM\_044546) is another

VGAM828 host target gene. KIAA0453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:34231, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31989] Another function of VGAM828 is therefore inhibition of KIAA0453 (Accession XM\_044546). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0453. KR18 (Accession NM\_033288) is another VGAM828 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27120, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31990] Another function of VGAM828 is therefore inhibition of KR18 (Accession NM\_033288). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LAT1-3TM (Accession NM\_031211) is another VGAM828 host target gene. LAT1-3TM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAT1-3TM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAT1-3TM BINDING SITE, designated SEQ ID:25253, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31991] Another function of VGAM828 is therefore inhibition of LAT1-3TM (Accession NM\_031211). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAT1-3TM. MEGF10 (Accession NM\_032446) is another VGAM828 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26214, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31992] Another function of VGAM828 is therefore inhibition of MEGF10 (Accession NM\_032446). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. MGC2488 (Accession NM\_024039) is another VGAM828 host target gene. MGC2488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2488 BINDING SITE, designated SEQ ID:23474, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31993] Another function of VGAM828 is therefore inhibition of MGC2488 (Accession NM\_024039). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2488. Stromal Interaction Molecule 2 (STIM2, Accession NM\_020860) is another VGAM828 host target gene. STIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM2 BINDING SITE, designated SEQ ID:21917, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31994] Another function of VGAM828 is therefore inhibition of Stromal Interaction Molecule 2 (STIM2, Accession NM\_020860). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIM2. LOC120103 (Accession XM\_058449) is another VGAM828 host target gene. LOC120103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120103 BINDING SITE, desig-

nated SEQ ID:36619, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31995] Another function of VGAM828 is therefore inhibition of LOC120103 (Accession XM\_058449). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120103. LOC138639 (Accession XM\_059988) is another VGAM828 host target gene. LOC138639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138639 BINDING SITE, designated SEQ ID:37140, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31996] Another function of VGAM828 is therefore inhibition of LOC138639 (Accession XM\_059988). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138639. LOC145945 (Accession XM\_096908) is another VGAM828 host target gene. LOC145945 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40635, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31997] Another function of VGAM828 is therefore inhibition of LOC145945 (Accession XM\_096908). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC197423 (Accession XM\_085436) is another VGAM828 host target gene. LOC197423 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197423 BINDING SITE, designated SEQ ID:38144, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31998] Another function of VGAM828 is therefore inhibition of

LOC197423 (Accession XM\_085436). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197423. LOC220672 (Accession XM\_017177) is another VGAM828 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:30310, to the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, also designated SEQ ID:3539.

[31999] Another function of VGAM828 is therefore inhibition of LOC220672 (Accession XM\_017177). Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 829 (VGAM829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[32000] VGAM829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM829 was detected is described hereinabove with reference to Figs. 1–8.

[32001] VGAM829 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32002] VGAM829 gene encodes a VGAM829 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM829 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM829 precursor RNA is designated SEQ ID:815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:815 is located at position 13995 relative to the genome of African Swine Fever Virus.

[32003] VGAM829 precursor RNA folds onto itself, forming VGAM829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[32004] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM829 folded precursor RNA into VGAM829 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM829 RNA is designated SEQ ID:3540, and  
is provided hereinbelow with reference to the sequence  
listing part.

[32005] VGAM829 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM829 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM829 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32006] VGAM829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM829 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[32007] The complementary binding of VGAM829 RNA, herein designated VGAM RNA, to host target binding sites on VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM829 host target RNA into VGAM829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32008] It is appreciated that VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM829 host target genes. The mRNA of each one of this plurality of VGAM829 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM829 RNA, herein designated VGAM RNA, and which when bound by VGAM829 RNA causes inhibition of translation of respective one or more VGAM829 host target proteins.

[32009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM829 gene, herein designated VGAM GENE, on one or

more VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32010] It is yet further appreciated that a function of VGAM829 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM829 correlate with, and may be deduced from, the identity of the host target genes which VGAM829 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [32011] Nucleotide sequences of the VGAM829 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM829 are further described hereinbelow with reference to Table 1.
- [32012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM829 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [32013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM829 gene, herein designated VGAM is inhibition of expression of VGAM829 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM829 correlate with, and may be deduced from, the identity of the target genes which VGAM829 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [32014] Transcription Factor 12 (HTF4, helix-loop-helix transcrip-

tion factors 4) (TCF12, Accession NM\_003205) is a VGAM829 host target gene. TCF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF12 BINDING SITE, designated SEQ ID:9201, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32015] A function of VGAM829 is therefore inhibition of Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM\_003205), a gene which may play important roles during development of the nervous system as well as in other organ systems. Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF12. The function of TCF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM308.UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM\_048735) is another VGAM829 host target

gene. B3GNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT7 BINDING SITE, designated SEQ ID:35239, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32016] Another function of VGAM829 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM\_048735). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT7. KIAA1344 (Accession XM\_051699) is another VGAM829 host target gene. KIAA1344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35872, to the nucleotide sequence of VGAM829

RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32017] Another function of VGAM829 is therefore inhibition of KIAA1344 (Accession XM\_051699). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. KIAA1894 (Accession XM\_058025) is another VGAM829 host target gene. KIAA1894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1894 BINDING SITE, designated SEQ ID:36562, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32018] Another function of VGAM829 is therefore inhibition of KIAA1894 (Accession XM\_058025). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1894. PIP3-E (Accession XM\_039749) is another VGAM829 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33175, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32019] Another function of VGAM829 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM\_003350) is another VGAM829 host target gene. UBE2V2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2V2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V2 BINDING SITE, designated SEQ ID:9377, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32020] Another function of VGAM829 is therefore inhibition of

Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM\_003350). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V2.

LOC253143 (Accession XM\_173062) is another VGAM829 host target gene. LOC253143 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253143 BINDING SITE, designated SEQ ID:46316, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32021] Another function of VGAM829 is therefore inhibition of LOC253143 (Accession XM\_173062). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253143. LOC254170 (Accession XM\_170746) is another VGAM829 host target gene. LOC254170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254170, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254170 BINDING SITE, designated SEQ ID:45505, to the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, also designated SEQ ID:3540.

[32022] Another function of VGAM829 is therefore inhibition of LOC254170 (Accession XM\_170746). Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 830 (VGAM830) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32023] VGAM830 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM830 was detected is described hereinabove with reference to Figs. 1–8.

[32024] VGAM830 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM830 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32025] VGAM830 gene encodes a VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM830 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM830 precursor RNA is designated SEQ ID:816, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:816 is located at position 11737 relative to the genome of African Swine Fever Virus.

[32026] VGAM830 precursor RNA folds onto itself, forming VGAM830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32027] An enzyme complex designated DICER COMPLEX, `dices` the VGAM830 folded precursor RNA into VGAM830 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM830 RNA is designated SEQ ID:3541, and is provided hereinbelow with reference to the sequence listing part.

[32028] VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM830 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32029] VGAM830 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM830 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM830 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32030] The complementary binding of VGAM830 RNA, herein designated VGAM RNA, to host target binding sites on VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM830 host target RNA into VGAM830 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[32031] It is appreciated that VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM830 host target genes. The mRNA of each one of this plurality of VGAM830 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM830 RNA, herein designated VGAM RNA, and which when bound by VGAM830 RNA causes inhibition of translation of respective one or more VGAM830 host target proteins.

[32032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM830 gene, herein designated VGAM GENE, on one or more VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32033] It is yet further appreciated that a function of VGAM830 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM830 correlate with, and may be deduced from, the identity of the host target genes which VGAM830 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32034] Nucleotide sequences of the VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM830 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM830 are further described hereinbelow with reference to Table 1.

[32035] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM830 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM830 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32036] As mentioned hereinabove with reference to Fig. 1, a function of VGAM830 gene, herein designated VGAM is inhibition of expression of VGAM830 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM830 correlate with, and may be deduced from, the identity of the target genes which VGAM830 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32037] Moesin (MSN, Accession XM\_013042) is a VGAM830 host target gene. MSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSN BINDING SITE, designated SEQ ID:30225, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ

ID:3541.

[32038] A function of VGAM830 is therefore inhibition of Moesin (MSN, Accession XM\_013042), a gene which may have a role linking the cytoskeleton to the plasma membrane. Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSN. The function of MSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM248. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM830 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8523, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32039] Another function of VGAM830 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655), a gene which contains a zinc finger domain.

Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Ubiquitously Transcribed Tetratricopeptide Repeat Gene, Y Chromosome (UTY, Accession NM\_007125) is another VGAM830 host target gene. UTY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UTY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UTY BINDING SITE, designated SEQ ID:13982, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32040] Another function of VGAM830 is therefore inhibition of Ubiquitously Transcribed Tetratricopeptide Repeat Gene, Y Chromosome (UTY, Accession NM\_007125), a gene which is an ubiquitous tetratricopeptide repeat protein with unknown function. Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with UTY. The function of UTY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. ABLIM (Accession NM\_002313) is another VGAM830 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8113 and SEQ ID:13546 respectively, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32041] Another function of VGAM830 is therefore inhibition of ABLIM (Accession NM\_002313). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. KIAA0650 (Accession XM\_113962) is another VGAM830 host target gene. KIAA0650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0650, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0650 BINDING SITE, designated SEQ ID:42570, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32042] Another function of VGAM830 is therefore inhibition of KIAA0650 (Accession XM\_113962). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0650. KIAA1560 (Accession XM\_034422) is another VGAM830 host target gene. KIAA1560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32103, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32043] Another function of VGAM830 is therefore inhibition of KIAA1560 (Accession XM\_034422). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1560. TUSP (Accession NM\_020245) is another VGAM830 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21529, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32044] Another function of VGAM830 is therefore inhibition of TUSP (Accession NM\_020245). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC126731 (Accession NM\_145257) is another VGAM830 host target gene. LOC126731 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126731 BINDING SITE, designated SEQ ID:29772, to the nucleotide se-

quence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32045] Another function of VGAM830 is therefore inhibition of LOC126731 (Accession NM\_145257). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126731. LOC129831 (Accession XM\_059376) is another VGAM830 host target gene. LOC129831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129831 BINDING SITE, designated SEQ ID:36979, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32046] Another function of VGAM830 is therefore inhibition of LOC129831 (Accession XM\_059376). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129831. LOC157858 (Accession XM\_098833) is another VGAM830 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41868, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32047] Another function of VGAM830 is therefore inhibition of LOC157858 (Accession XM\_098833). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC199718 (Accession XM\_113998) is another VGAM830 host target gene. LOC199718 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199718 BINDING SITE, designated SEQ ID:42606, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32048] Another function of VGAM830 is therefore inhibition of LOC199718 (Accession XM\_113998). Accordingly, utilities

of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199718. LOC221288 (Accession XM\_168058) is another VGAM830 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44972, to the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, also designated SEQ ID:3541.

[32049] Another function of VGAM830 is therefore inhibition of LOC221288 (Accession XM\_168058). Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 831 (VGAM831) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32050] VGAM831 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM831 was detected is described hereinabove with reference to Figs. 1–8.

[32051] VGAM831 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6B. VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32052] VGAM831 gene encodes a VGAM831 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM831 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM831 precursor RNA is designated SEQ ID:817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:817 is located at position 53746 relative to the genome of Human Herpesvirus 6B.

[32053] VGAM831 precursor RNA folds onto itself, forming VGAM831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM831 folded precursor RNA into VGAM831 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM831 RNA is designated SEQ ID:3542, and is provided hereinbelow with reference to the sequence listing part.

[32055] VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM831 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[32056] VGAM831 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM831 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM831 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32057] The complementary binding of VGAM831 RNA, herein designated VGAM RNA, to host target binding sites on VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM831 host target RNA into VGAM831 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32058] It is appreciated that VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM831 host target genes. The mRNA of each one of this plurality of VGAM831 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM831 RNA, herein designated VGAM RNA, and which when bound by VGAM831 RNA causes inhibition of translation of respective one or more VGAM831 host target proteins.

[32059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM831 gene, herein designated VGAM GENE, on one or more VGAM831 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32060] It is yet further appreciated that a function of VGAM831 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM831 correlate with, and may be deduced from, the identity of the host target genes which VGAM831 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32061] Nucleotide sequences of the VGAM831 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM831 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM831 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM831 are further  
described hereinbelow with reference to Table 1.

[32062] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM831 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM831 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[32063] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM831 gene, herein designated VGAM is  
inhibition of expression of VGAM831 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM831 correlate with, and may be deduced  
from, the identity of the target genes which VGAM831  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[32064] Deleted In Azoospermia (DAZ, Accession NM\_004081) is a  
VGAM831 host target gene. DAZ BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by DAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:10285, to the nucleotide sequence of VGAM831 RNA, herein designated VGAM RNA, also designated SEQ ID:3542.

[32065] A function of VGAM831 is therefore inhibition of Deleted In Azoospermia (DAZ, Accession NM\_004081), a gene which may play a role in the germ-cell-specific patterns of RNA splicing and storage. Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZ. The function of DAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.DKFZp434N074 (Accession XM\_031481) is another VGAM831 host target gene. DKFZp434N074 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434N074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZp434N074 BINDING SITE, designated SEQ ID:31390, to the nucleotide sequence of VGAM831 RNA, herein designated VGAM RNA, also designated SEQ ID:3542.

[32066] Another function of VGAM831 is therefore inhibition of DKFZp434N074 (Accession XM\_031481). Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N074. FLJ10140 (Accession NM\_018006) is another VGAM831 host target gene. FLJ10140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10140 BINDING SITE, designated SEQ ID:19738, to the nucleotide sequence of VGAM831 RNA, herein designated VGAM RNA, also designated SEQ ID:3542.

[32067] Another function of VGAM831 is therefore inhibition of FLJ10140 (Accession NM\_018006). Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10140.

LOC201780 (Accession XM\_114378) is another VGAM831 host target gene. LOC201780 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201780, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201780 BINDING SITE, designated SEQ ID:42910, to the nucleotide sequence of VGAM831 RNA, herein designated VGAM RNA, also designated SEQ ID:3542.

[32068] Another function of VGAM831 is therefore inhibition of LOC201780 (Accession XM\_114378). Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201780. LOC256160 (Accession XM\_171079) is another VGAM831 host target gene. LOC256160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256160 BINDING SITE, designated SEQ ID:45886, to the nucleotide sequence of VGAM831 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3542.

[32069] Another function of VGAM831 is therefore inhibition of LOC256160 (Accession XM\_171079). Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256160. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 832 (VGAM832) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32070] VGAM832 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM832 was detected is described hereinabove with reference to Figs. 1–8.

[32071] VGAM832 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6B. VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32072] VGAM832 gene encodes a VGAM832 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM832 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM832 precursor RNA is designated SEQ ID:818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:818 is located at position 52788 relative to the genome of Human Herpesvirus 6B.

[32073] VGAM832 precursor RNA folds onto itself, forming VGAM832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32074] An enzyme complex designated DICER COMPLEX, `dices` the VGAM832 folded precursor RNA into VGAM832 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM832 RNA is designated SEQ ID:3543, and is provided hereinbelow with reference to the sequence listing part.

[32075] VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM832 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32076] VGAM832 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM832 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM832 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32077] The complementary binding of VGAM832 RNA, herein designated VGAM RNA, to host target binding sites on VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM832 host target RNA into VGAM832 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32078] It is appreciated that VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM832 host target genes. The mRNA of

each one of this plurality of VGAM832 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM832 RNA, herein designated VGAM RNA, and which when bound by VGAM832 RNA causes inhibition of translation of respective one or more VGAM832 host target proteins.

[32079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM832 gene, herein designated VGAM GENE, on one or more VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32080] It is yet further appreciated that a function of VGAM832 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM832 correlate with, and may be deduced from, the identity of the host target genes which VGAM832 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32081] Nucleotide sequences of the VGAM832 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM832 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM832 are further described hereinbelow with reference to Table 1.

[32082] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM832 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM832 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32083] As mentioned hereinabove with reference to Fig. 1, a function of VGAM832 gene, herein designated VGAM is inhibition of expression of VGAM832 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM832 correlate with, and may be deduced from, the identity of the target genes which VGAM832 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32084] Selenoprotein N, 1 (SEPN1, Accession XM\_039033) is a VGAM832 host target gene. SEPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPN1 BINDING SITE, designated SEQ ID:32992, to the nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, also designated SEQ ID:3543.

[32085] A function of VGAM832 is therefore inhibition of Selenoprotein N, 1 (SEPN1, Accession XM\_039033). Accordingly, utilities of VGAM832 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SEPN1. KIAA1055 (Accession XM\_038509) is another VGAM832 host target gene. KIAA1055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1055 BINDING SITE, designated SEQ ID:32852, to the nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, also designated SEQ ID:3543.

[32086] Another function of VGAM832 is therefore inhibition of KIAA1055 (Accession XM\_038509). Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1055. KIAA1951 (Accession XM\_057401) is another VGAM832 host target gene. KIAA1951 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1951 BINDING SITE, designated SEQ ID:36513, to the

nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, also designated SEQ ID:3543.

[32087] Another function of VGAM832 is therefore inhibition of KIAA1951 (Accession XM\_057401). Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1951. NYD-SP27 (Accession NM\_033123) is another VGAM832 host target gene. NYD-SP27 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NYD-SP27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP27 BINDING SITE, designated SEQ ID:26968, to the nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, also designated SEQ ID:3543.

[32088] Another function of VGAM832 is therefore inhibition of NYD-SP27 (Accession NM\_033123). Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP27. LOC92223 (Accession XM\_043674) is another VGAM832 host target gene. LOC92223 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC92223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92223 BINDING SITE, designated SEQ ID:33995, to the nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, also designated SEQ ID:3543.

[32089] Another function of VGAM832 is therefore inhibition of LOC92223 (Accession XM\_043674). Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92223. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 833 (VGAM833) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32090] VGAM833 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM833 was detected is described hereinabove with reference to Figs. 1–8.

[32091] VGAM833 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Monkeypox Virus.

VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32092] VGAM833 gene encodes a VGAM833 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM833 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM833 precursor RNA is designated SEQ ID:819, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:819 is located at position 185114 relative to the genome of Monkeypox Virus.

[32093] VGAM833 precursor RNA folds onto itself, forming VGAM833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM833 folded precursor RNA into VGAM833 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM833 RNA is designated SEQ ID:3544, and is provided hereinbelow with reference to the sequence listing part.

[32095] VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM833 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32096] VGAM833 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM833 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM833 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32097] The complementary binding of VGAM833 RNA, herein designated VGAM RNA, to host target binding sites on VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM833 host tar-

get RNA into VGAM833 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32098] It is appreciated that VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM833 host target genes. The mRNA of each one of this plurality of VGAM833 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM833 RNA, herein designated VGAM RNA, and which when bound by VGAM833 RNA causes inhibition of translation of respective one or more VGAM833 host target proteins.

[32099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM833 gene, herein designated VGAM GENE, on one or more VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32100] It is yet further appreciated that a function of VGAM833 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM833 correlate with, and may be deduced from, the identity of the host target genes which VGAM833 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32101] Nucleotide sequences of the VGAM833 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM833 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM833 are further

described hereinbelow with reference to Table 1.

[32102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM833 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM833 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM833 gene, herein designated VGAM is inhibition of expression of VGAM833 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM833 correlate with, and may be deduced from, the identity of the target genes which VGAM833 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32104] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093) is a VGAM833 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11546, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32105] A function of VGAM833 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM\_003189) is another VGAM833 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9173, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3544.

[32106] Another function of VGAM833 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM\_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.KIAA0798 (Accession NM\_014650) is another VGAM833 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16067, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32107] Another function of VGAM833 is therefore inhibition of KIAA0798 (Accession NM\_014650). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0798. KIAA1155 (Accession XM\_030864) is another VGAM833 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31198, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32108] Another function of VGAM833 is therefore inhibition of KIAA1155 (Accession XM\_030864). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702) is another VGAM833 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated

SEQ ID:34265, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32109] Another function of VGAM833 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10.

LOC154739 (Accession XM\_098602) is another VGAM833 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41713, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32110] Another function of VGAM833 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC203276 (Accession XM\_117523) is an-

other VGAM833 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43480, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32111] Another function of VGAM833 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM833 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43504, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32112] Another function of VGAM833 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM\_173233) is another VGAM833 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46506, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32113] Another function of VGAM833 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC51131 (Accession NM\_016119) is another VGAM833 host target gene. LOC51131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51131, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51131 BINDING SITE, designated SEQ ID:18201, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32114] Another function of VGAM833 is therefore inhibition of LOC51131 (Accession NM\_016119). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51131. LOC90038 (Accession XM\_028305) is another VGAM833 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30643, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32115] Another function of VGAM833 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90038. LOC91115 (Accession XM\_036218) is another VGAM833 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32392, to the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, also designated SEQ ID:3544.

[32116] Another function of VGAM833 is therefore inhibition of LOC91115 (Accession XM\_036218). Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 834 (VGAM834) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32117] VGAM834 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM834 was detected is described hereinabove with reference to Figs. 1–8.

[32118] VGAM834 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus.

VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32119] VGAM834 gene encodes a VGAM834 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM834 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM834 precursor RNA is designated SEQ ID:820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:820 is located at position 183909 relative to the genome of Monkeypox Virus.

[32120] VGAM834 precursor RNA folds onto itself, forming VGAM834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32121] An enzyme complex designated DICER COMPLEX, `dices` the VGAM834 folded precursor RNA into VGAM834 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM834 RNA is designated SEQ ID:3545, and is provided hereinbelow with reference to the sequence listing part.

[32122] VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM834 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32123] VGAM834 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM834 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM834 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[32124] The complementary binding of VGAM834 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM834 host target RNA into VGAM834 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32125] It is appreciated that VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM834 host target genes. The mRNA of each one of this plurality of VGAM834 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM834 RNA, herein designated VGAM RNA, and which when bound by VGAM834 RNA causes inhibition of translation of respective one or more VGAM834 host target proteins.

[32126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM834 gene, herein designated VGAM GENE, on one or more VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32127] It is yet further appreciated that a function of VGAM834 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM834 correlate with, and may be deduced from, the identity of the host target genes which VGAM834 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32128] Nucleotide sequences of the VGAM834 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM834 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM834 are further described hereinbelow with reference to Table 1.

[32129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM834 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM834 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32130] As mentioned hereinabove with reference to Fig. 1, a function of VGAM834 gene, herein designated VGAM is inhibition of expression of VGAM834 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM834 correlate with, and may be deduced from, the identity of the target genes which VGAM834 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32131] ALG6 (Accession NM\_013339) is a VGAM834 host target gene. ALG6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALG6, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALG6 BINDING SITE, designated SEQ ID:14987, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32132] A function of VGAM834 is therefore inhibition of ALG6 (Accession NM\_013339). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALG6. Bromodomain Adjacent to Zinc Finger Domain, 2A (BAZ2A, Accession NM\_013449) is another VGAM834 host target gene. BAZ2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAZ2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ2A BINDING SITE, designated SEQ ID:15119, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32133] Another function of VGAM834 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 2A (BAZ2A, Accession NM\_013449). Accordingly, utilities of VGAM834

include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ2A. B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is another VGAM834 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6259, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32134] Another function of VGAM834 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243) is another VGAM834 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:29964, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32135] Another function of VGAM834 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243), a gene which may have a growth inhibitory role. Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Epsin 2 (EPN2, Accession NM\_014964) is another VGAM834 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:17349, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32136] Another function of VGAM834 is therefore inhibition of Epsin 2 (EPN2, Accession NM\_014964). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. FLJ31952 (Accession NM\_144682) is another VGAM834 host target gene. FLJ31952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ31952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31952 BINDING SITE, designated SEQ ID:29497, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32137] Another function of VGAM834 is therefore inhibition of FLJ31952 (Accession NM\_144682). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31952. H326 (Accession NM\_015726) is another VGAM834 host target gene. H326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of H326 BINDING SITE, designated SEQ ID:17937, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32138] Another function of VGAM834 is therefore inhibition of H326 (Accession NM\_015726). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H326. Hyaluronan Binding Protein 4 (HABP4, Accession XM\_047263) is another VGAM834 host target gene. HABP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HABP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP4 BINDING SITE, designated SEQ ID:34925, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32139] Another function of VGAM834 is therefore inhibition of Hyaluronan Binding Protein 4 (HABP4, Accession XM\_047263). Accordingly, utilities of VGAM834 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP4. KIAA0894 (Accession NM\_014896) is another VGAM834 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17054, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32140] Another function of VGAM834 is therefore inhibition of KIAA0894 (Accession NM\_014896). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. KIAA1157 (Accession XM\_051093) is another VGAM834 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1157 BINDING SITE, designated SEQ ID:35748, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32141] Another function of VGAM834 is therefore inhibition of KIAA1157 (Accession XM\_051093). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. KIAA1594 (Accession XM\_050754) is another VGAM834 host target gene. KIAA1594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1594 BINDING SITE, designated SEQ ID:35675, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32142] Another function of VGAM834 is therefore inhibition of KIAA1594 (Accession XM\_050754). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1594. MGC12928 (Accession NM\_032891) is another VGAM834 host target gene. MGC12928 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC12928, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12928 BINDING SITE, designated SEQ ID:26714, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32143] Another function of VGAM834 is therefore inhibition of MGC12928 (Accession NM\_032891). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12928. LOC142955 (Accession XM\_084389) is another VGAM834 host target gene. LOC142955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC142955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:37574, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32144] Another function of VGAM834 is therefore inhibition of

LOC142955 (Accession XM\_084389). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955. LOC144519 (Accession XM\_084890) is another VGAM834 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37757, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32145] Another function of VGAM834 is therefore inhibition of LOC144519 (Accession XM\_084890). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. LOC146056 (Accession XM\_085299) is another VGAM834 host target gene. LOC146056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146056 BINDING SITE, designated SEQ ID:38051, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32146] Another function of VGAM834 is therefore inhibition of LOC146056 (Accession XM\_085299). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146056. LOC149153 (Accession XM\_097599) is another VGAM834 host target gene. LOC149153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149153 BINDING SITE, designated SEQ ID:40965, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32147] Another function of VGAM834 is therefore inhibition of LOC149153 (Accession XM\_097599). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149153. LOC149420 (Accession XM\_086530) is an-

other VGAM834 host target gene. LOC149420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:38747, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32148] Another function of VGAM834 is therefore inhibition of LOC149420 (Accession XM\_086530). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149420. LOC92106 (Accession NM\_138381) is another VGAM834 host target gene. LOC92106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92106 BINDING SITE, designated SEQ ID:28756, to the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, also designated SEQ ID:3545.

[32149] Another function of VGAM834 is therefore inhibition of LOC92106 (Accession NM\_138381). Accordingly, utilities of VGAM834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92106. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 835 (VGAM835) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32150] VGAM835 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM835 was detected is described hereinabove with reference to Figs. 1–8.

[32151] VGAM835 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32152] VGAM835 gene encodes a VGAM835 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM835

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM835 precursor RNA is designated SEQ ID:821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:821 is located at position 184176 relative to the genome of Monkeypox Virus.

[32153] VGAM835 precursor RNA folds onto itself, forming VGAM835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32154] An enzyme complex designated DICER COMPLEX, `dices` the VGAM835 folded precursor RNA into VGAM835 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 47%) nucleotide sequence of VGAM835 RNA is designated SEQ ID:3546, and is provided hereinbelow with reference to the sequence listing part.

[32155] VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM835 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32156] VGAM835 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM835 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM835 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32157] The complementary binding of VGAM835 RNA, herein designated VGAM RNA, to host target binding sites on VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM835 host target RNA into VGAM835 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32158] It is appreciated that VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM835 host target genes. The mRNA of each one of this plurality of VGAM835 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM835 RNA, herein designated VGAM RNA, and which when bound by VGAM835 RNA causes inhibition of translation of respective one or more VGAM835 host target proteins.

[32159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM835 gene, herein designated VGAM GENE, on one or more VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32160] It is yet further appreciated that a function of VGAM835 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM835 correlate with, and may be deduced from, the identity of the host target genes which VGAM835 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32161] Nucleotide sequences of the VGAM835 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM835 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM835 are further described hereinbelow with reference to Table 1.

[32162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM835 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM835 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[32163] As mentioned hereinabove with reference to Fig. 1, a function of VGAM835 gene, herein designated VGAM is inhibition of expression of VGAM835 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM835 correlate with, and may be deduced from, the identity of the target genes which VGAM835 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32164] Growth Arrest-specific 7 (GAS7, Accession NM\_003644) is a VGAM835 host target gene. GAS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:9714, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32165] A function of VGAM835 is therefore inhibition of Growth Arrest-specific 7 (GAS7, Accession NM\_003644), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. Accord-

ingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS7. The function of GAS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Heparan Sulfate

2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM835 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14577, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32166] Another function of VGAM835 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Leucine Zipper Protein 1 (LUZP1, Accession NM\_033631) is another VGAM835 host target gene. LUZP1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by LUZP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUZP1 BINDING SITE, designated SEQ ID:27351, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32167] Another function of VGAM835 is therefore inhibition of Leucine Zipper Protein 1 (LUZP1, Accession NM\_033631). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUZP1. Synovial Sarcoma, X Breakpoint 3 (SSX3, Accession NM\_021014) is another VGAM835 host target gene. SSX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSX3 BINDING SITE, designated SEQ ID:22003, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32168] Another function of VGAM835 is therefore inhibition of Synovial Sarcoma, X Breakpoint 3 (SSX3, Accession NM\_021014), a gene which could act as a modulator of transcription. Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSX3. The function of SSX3 has been established by previous studies. By screening a testis cDNA library with a partial fragment of the SSX2 (OMIM Ref. No. 300192) gene, de Leeuw et al. (1996) identified SSX3, a novel member of the Kruppel-associated box (KRAB)-containing SSX gene family. SSX3 encodes a deduced 188-amino acid protein that shares 90% sequence identity with SSX2. Unlike SSX1 (OMIM Ref. No. 312820) and SSX2, SSX3 appears not to be involved in the chromosome translocation t(X;18)(p11.2;q11.2) commonly found in synovial sarcomas. Gure et al. (1997) independently cloned the SSX3 gene and showed that it is expressed in normal testis only. Analysis of 12 melanoma cell lines detected no expression of SSX3.

[32169] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32170] de Leeuw, B.; Balemans, M.; Geurts van Kessel, A. : A novel

Kruppel-associated box containing the SSX gene (SSX3) on the human X chromosome is not implicated in t(X;18)-positive synovial sarcomas. Cytogenet. Cell Genet. 73: 179-183, 1996. ; and

[32171] Gure, A. O.; Tureci, O.; Sahin, U.; Tsang, S.; Scanlan, M. J.; Jager, E.; Knuth, A.; Pfreundschuh, M.; Old, L. J.; Chen, Y.-T. : SSX: a multigene family with several members transcribed.

[32172] Further studies establishing the function and utilities of SSX3 are found in John Hopkins OMIM database record ID 300325, and in cited publications numbered 9146-9147 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966) is another VGAM835 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27536, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32173] Another function of VGAM835 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. DKFZP586C1619 (Accession XM\_030350) is another VGAM835 host target gene. DKFZP586C1619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586C1619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586C1619 BINDING SITE, designated SEQ ID:31021, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32174] Another function of VGAM835 is therefore inhibition of DKFZP586C1619 (Accession XM\_030350). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1619. Dickkopf Homolog 2 (*Xenopus laevis*) (DKK2, Accession NM\_014421) is another VGAM835 host target gene. DKK2 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:15773, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32175] Another function of VGAM835 is therefore inhibition of Dickkopf Homolog 2 (*Xenopus laevis*) (DKK2, Accession NM\_014421). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2. FLJ14213 (Accession NM\_024841) is another VGAM835 host target gene. FLJ14213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14213 BINDING SITE, designated SEQ ID:24255, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32176] Another function of VGAM835 is therefore inhibition of FLJ14213 (Accession NM\_024841). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14213. FLJ23548 (Accession NM\_024590) is another VGAM835 host target gene. FLJ23548 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23548 BINDING SITE, designated SEQ ID:23825, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32177] Another function of VGAM835 is therefore inhibition of FLJ23548 (Accession NM\_024590). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23548. KIAA0831 (Accession NM\_014924) is another VGAM835 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17209, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32178] Another function of VGAM835 is therefore inhibition of KIAA0831 (Accession NM\_014924). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. MGC13061 (Accession NM\_032322) is another VGAM835 host target gene. MGC13061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13061 BINDING SITE, designated SEQ ID:26129, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32179] Another function of VGAM835 is therefore inhibition of MGC13061 (Accession NM\_032322). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC13061. LOC154739 (Accession XM\_098602) is another VGAM835 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41719, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32180] Another function of VGAM835 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC203276 (Accession XM\_117523) is another VGAM835 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43487, to the nucleotide sequence of VGAM835 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3546.

[32181] Another function of VGAM835 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM835 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43511, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32182] Another function of VGAM835 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC219686 (Accession XM\_165544) is another VGAM835 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219686, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43675, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32183] Another function of VGAM835 is therefore inhibition of LOC219686 (Accession XM\_165544). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. LOC254243 (Accession XM\_173233) is another VGAM835 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46514, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32184] Another function of VGAM835 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC254243. LOC63923 (Accession XM\_040527) is another VGAM835 host target gene. LOC63923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC63923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63923 BINDING SITE, designated SEQ ID:33324, to the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32185] Another function of VGAM835 is therefore inhibition of LOC63923 (Accession XM\_040527). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63923. LOC90038 (Accession XM\_028305) is another VGAM835 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30651, to the

nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, also designated SEQ ID:3546.

[32186] Another function of VGAM835 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 836 (VGAM836) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32187] VGAM836 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM836 was detected is described hereinabove with reference to Figs. 1–8.

[32188] VGAM836 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32189] VGAM836 gene encodes a VGAM836 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM836 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM836 precursor RNA is designated SEQ ID:822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:822 is located at position 185395 relative to the genome of Monkeypox Virus.

[32190] VGAM836 precursor RNA folds onto itself, forming VGAM836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32191] An enzyme complex designated DICER COMPLEX, `dices` the VGAM836 folded precursor RNA into VGAM836 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM836 RNA is designated SEQ ID:3547, and is provided hereinbelow with reference to the sequence listing part.

[32192] VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM836 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32193] VGAM836 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM836 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM836 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32194] The complementary binding of VGAM836 RNA, herein designated VGAM RNA, to host target binding sites on VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM836 host target RNA into VGAM836 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32195] It is appreciated that VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM836 host target genes. The mRNA of each one of this plurality of VGAM836 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM836 RNA, herein designated VGAM RNA, and which when bound by VGAM836 RNA causes inhibition of translation of respective one or more VGAM836 host target proteins.

[32196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM836 gene, herein designated VGAM GENE, on one or more VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[32197] It is yet further appreciated that a function of VGAM836 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM836 correlate with, and may be deduced from, the identity of the host target genes which VGAM836 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[32198] Nucleotide sequences of the VGAM836 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM836 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM836 are further described hereinbelow with reference to Table 1.

[32199] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM836 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM836 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32200] As mentioned hereinabove with reference to Fig. 1, a function of VGAM836 gene, herein designated VGAM is inhibition of expression of VGAM836 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM836 correlate with, and may be deduced from, the identity of the target genes which VGAM836 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32201] Ribosomal Protein L15 (RPL15, Accession NM\_002948) is a VGAM836 host target gene. RPL15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:8860, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32202] A function of VGAM836 is therefore inhibition of Ribosomal Protein L15 (RPL15, Accession NM\_002948). Accord-

ingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL15. BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM\_078469) is another VGAM836 host target gene. BCCIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCCIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCCIP BINDING SITE, designated SEQ ID:27786, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32203] Another function of VGAM836 is therefore inhibition of BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM\_078469). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCCIP. KIAA1110 (Accession XM\_029973) is another VGAM836 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30981, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32204] Another function of VGAM836 is therefore inhibition of KIAA1110 (Accession XM\_029973). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110. KIAA1877 (Accession XM\_038616) is another VGAM836 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32885, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32205] Another function of VGAM836 is therefore inhibition of KIAA1877 (Accession XM\_038616). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1877. Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM\_000950) is another VGAM836 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6656, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32206] Another function of VGAM836 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM\_000950). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. LOC149910 (Accession XM\_086699) is another VGAM836 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING

SITE, designated SEQ ID:38828, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32207] Another function of VGAM836 is therefore inhibition of LOC149910 (Accession XM\_086699). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC151405 (Accession XM\_098058) is another VGAM836 host target gene. LOC151405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151405 BINDING SITE, designated SEQ ID:41338, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32208] Another function of VGAM836 is therefore inhibition of LOC151405 (Accession XM\_098058). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151405. LOC153196 (Accession XM\_098323) is another VGAM836 host target gene. LOC153196 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41587, to the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, also designated SEQ ID:3547.

[32209] Another function of VGAM836 is therefore inhibition of LOC153196 (Accession XM\_098323). Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 837 (VGAM837) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32210] VGAM837 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM837 was detected is described hereinabove with reference to Figs. 1-8.

[32211] VGAM837 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus.

VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32212] VGAM837 gene encodes a VGAM837 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM837 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM837 precursor RNA is designated SEQ ID:823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:823 is located at position 183768 relative to the genome of Monkeypox Virus.

[32213] VGAM837 precursor RNA folds onto itself, forming VGAM837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[32214] An enzyme complex designated DICER COMPLEX, `dices` the VGAM837 folded precursor RNA into VGAM837 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM837 RNA is designated SEQ ID:3548, and is provided hereinbelow with reference to the sequence listing part.

[32215] VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM837 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32216] VGAM837 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM837 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM837 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM837 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32217] The complementary binding of VGAM837 RNA, herein designated VGAM RNA, to host target binding sites on VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM837 host target RNA into VGAM837 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32218] It is appreciated that VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM837 host target genes. The mRNA of each one of this plurality of VGAM837 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM837 RNA, herein designated VGAM RNA, and which when bound by VGAM837 RNA causes inhibition of translation of respective one or more VGAM837 host target proteins.

[32219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM837 gene, herein designated VGAM GENE, on one or more VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32220] It is yet further appreciated that a function of VGAM837 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM837 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM837 correlate with, and may be deduced from, the identity of the host target genes which VGAM837 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32221] Nucleotide sequences of the VGAM837 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM837 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM837 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM837 are further described hereinbelow with reference to Table 1.

[32222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM837 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM837 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32223] As mentioned hereinabove with reference to Fig. 1, a function of VGAM837 gene, herein designated VGAM is inhibition of expression of VGAM837 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM837 correlate with, and may be deduced from, the identity of the target genes which VGAM837 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32224] Ubiquitin-like 3 (UBL3, Accession NM\_007106) is a VGAM837 host target gene. UBL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of UBL3 BINDING SITE, designated SEQ ID:13966, to the nucleotide sequence of VGAM837 RNA, herein designated VGAM RNA, also designated SEQ ID:3548.

[32225] A function of VGAM837 is therefore inhibition of Ubiquitin-like 3 (UBL3, Accession NM\_007106), a gene which appears to have a diverse range of cellular functions. Accordingly, utilities of VGAM837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL3. The function of UBL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.FLJ13611 (Accession NM\_024941) is another VGAM837 host target gene.

FLJ13611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13611 BINDING SITE, designated SEQ ID:24485, to the nucleotide sequence of VGAM837 RNA, herein designated VGAM RNA, also designated SEQ ID:3548.

- [32226] Another function of VGAM837 is therefore inhibition of FLJ13611 (Accession NM\_024941). Accordingly, utilities of VGAM837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13611. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 838 (VGAM838) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [32227] VGAM838 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM838 was detected is described hereinabove with reference to Figs. 1–8.
- [32228] VGAM838 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [32229] VGAM838 gene encodes a VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM838 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM838 precursor RNA is designated SEQ ID:824, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:824 is located at position 183284 relative to the genome of Monkeypox Virus.

[32230] VGAM838 precursor RNA folds onto itself, forming VGAM838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32231] An enzyme complex designated DICER COMPLEX, `dices` the VGAM838 folded precursor RNA into VGAM838 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM838 RNA is designated SEQ ID:3549, and is provided hereinbelow with reference to the sequence listing part.

[32232] VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM838 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[32233] VGAM838 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM838 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM838 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32234] The complementary binding of VGAM838 RNA, herein designated VGAM RNA, to host target binding sites on VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM838 host target RNA into VGAM838 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32235] It is appreciated that VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM838 host target genes. The mRNA of each one of this plurality of VGAM838 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM838 RNA, herein designated VGAM RNA, and which when bound by VGAM838 RNA causes inhibition of translation of respective one or more VGAM838 host target proteins.

[32236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM838 gene, herein designated VGAM GENE, on one or more VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32237] It is yet further appreciated that a function of VGAM838 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM838 correlate with, and may be deduced from, the identity of the host target genes which VGAM838 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[32238] Nucleotide sequences of the VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM838 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM838 are further described hereinbelow with reference to Table 1.

[32239] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM838 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM838 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32240] As mentioned hereinabove with reference to Fig. 1, a function of VGAM838 gene, herein designated VGAM is inhibition of expression of VGAM838 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM838 correlate with, and may be deduced from, the identity of the target genes which VGAM838 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32241] AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027) is a VGAM838 host target gene. AXUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, designated SEQ ID:26917, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32242] A function of VGAM838 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Cadherin 13, H-cadherin (heart)

(CDH13, Accession NM\_001257) is another VGAM838 host target gene. CDH13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH13 BINDING SITE, designated SEQ ID:6926, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32243] Another function of VGAM838 is therefore inhibition of Cadherin 13, H-cadherin (heart) (CDH13, Accession NM\_001257). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH13. Cytochrome P450, Subfamily XXVIIIB (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM\_000785) is another VGAM838 host target gene. CYP27B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP27B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CYP27B1 BINDING SITE, designated SEQ ID:6431, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32244] Another function of VGAM838 is therefore inhibition of Cytochrome P450, Subfamily XXVII B (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM\_000785). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP27B1. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434) is another VGAM838 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44335, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32245] Another function of VGAM838 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2

(DAAM2, Accession XM\_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. GRB2-associated Binding Protein 2 (GAB2, Accession NM\_012296) is another VGAM838 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:14650 and SEQ ID:27845 respectively, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32246] Another function of VGAM838 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM\_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM838 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM53. Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_078628) is another VGAM838 host target gene. MSL3L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSL3L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE, designated SEQ ID:27811, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32247] Another function of VGAM838 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_078628). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. Microsomal Triglyceride Transfer Protein (large polypeptide, 88kDa) (MTP, Accession NM\_000253) is another VGAM838

host target gene. MTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTP BINDING SITE, designated SEQ ID:5794, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32248] Another function of VGAM838 is therefore inhibition of Microsomal Triglyceride Transfer Protein (large polypeptide, 88kDa) (MTP, Accession NM\_000253). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTP. Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620) is another VGAM838 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6233, to the nucleotide sequence of VGAM838 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3549.

[32249] Another function of VGAM838 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.PATE (Accession NM\_138294) is another VGAM838 host target gene. PATE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PATE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PATE BINDING SITE, designated SEQ ID:28708, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32250] Another function of VGAM838 is therefore inhibition of PATE (Accession NM\_138294). Accordingly, utilities of

VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PATE.

Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM\_002480) is another VGAM838 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:8305, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32251] Another function of VGAM838 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM\_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A has been established by previous studies. Kimura et al. (1996) demonstrated that myosin phosphatase regulates the interaction of actin (see OMIM Ref. No. 102540) and myosin

(see OMIM Ref. No. 160710) downstream of the guanosine triphosphatase Rho. Rho appears to inhibit myosin phosphatase through the action of Rho-kinase. Using the rat Mypt1 cDNA as probe, Takahashi et al. (1997) cloned a 4,855-bp cDNA for a human gene they symbolized MYPT1. Sequencing analysis showed that human MYPT1 contains 1,030 amino acids with a calculated molecular mass of approximately 115 kD. By fluorescence in situ hybridization, Kimura et al. (1996) mapped the MYPT1 gene to 12q15-q21.2. By radiation hybrid analysis, they showed that MYPT1 is located close to a highly polymorphic marker that lies between D12S350 and D12S106.

[32252] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32253] Kimura, K.; Ito, M.; Amano, M.; Chihara, K.; Fukata, Y.; Nakafuku, M.; Yamamori, B.; Feng, J.; Nakano, T.; Okawa, K.; Iwamatsu, A.; Kaibuchi, K. : Regulation of myosin phosphatase by Rho and Rho-associated kinase (Rho-kinase). Science 273: 245-248, 1996. ; and

[32254] Takahashi, N.; Ito, M.; Tanaka, J.; Nakano, T.; Kaibuchi, K.; Odai, H.; Takemura, K. : Localization of the gene coding for myosin phosphatase, target subunit 1 (MYPT1) to hu-

man chromosom.

[32255] Further studies establishing the function and utilities of PPP1R12A are found in John Hopkins OMIM database record ID 602021, and in cited publications numbered 5829–5830 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ABLIM (Accession NM\_006720) is another VGAM838 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:13552 and SEQ ID:8119 respectively, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32256] Another function of VGAM838 is therefore inhibition of ABLIM (Accession NM\_006720). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. FLJ12768 (Accession NM\_025163) is another VGAM838 host target gene. FLJ12768 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ12768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12768 BINDING SITE, designated SEQ ID:24801, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32257] Another function of VGAM838 is therefore inhibition of FLJ12768 (Accession NM\_025163). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12768. FLJ14547 (Accession NM\_032804) is another VGAM838 host target gene. FLJ14547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14547 BINDING SITE, designated SEQ ID:26558, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32258] Another function of VGAM838 is therefore inhibition of

FLJ14547 (Accession NM\_032804). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14547. FLJ22477 (Accession NM\_024735) is another VGAM838 host target gene. FLJ22477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22477 BINDING SITE, designated SEQ ID:24076, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32259] Another function of VGAM838 is therefore inhibition of FLJ22477 (Accession NM\_024735). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22477. KIAA0227 (Accession XM\_027236) is another VGAM838 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30447, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32260] Another function of VGAM838 is therefore inhibition of KIAA0227 (Accession XM\_027236). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA0265 (Accession XM\_045954) is another VGAM838 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34619, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32261] Another function of VGAM838 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0298 (Accession XM\_084529) is another

VGAM838 host target gene. KIAA0298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:37623, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32262] Another function of VGAM838 is therefore inhibition of KIAA0298 (Accession XM\_084529). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0298. MGC4415 (Accession NM\_031484) is another VGAM838 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25565, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32263] Another function of VGAM838 is therefore inhibition of MGC4415 (Accession NM\_031484). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. Melanoma-derived Leucine Zipper, Extra-nuclear Factor (MLZE, Accession NM\_031415) is another VGAM838 host target gene. MLZE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MLZE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLZE BINDING SITE, designated SEQ ID:25395, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32264] Another function of VGAM838 is therefore inhibition of Melanoma-derived Leucine Zipper, Extra-nuclear Factor (MLZE, Accession NM\_031415). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLZE. NCE2 (Accession NM\_080678) is another VGAM838 host target gene. NCE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by NCE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCE2 BINDING SITE, designated SEQ ID:27972, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32265] Another function of VGAM838 is therefore inhibition of NCE2 (Accession NM\_080678). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCE2. p25 (Accession NM\_007030) is another VGAM838 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13889, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32266] Another function of VGAM838 is therefore inhibition of p25 (Accession NM\_007030). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with p25.

LOC149706 (Accession XM\_097718) is another VGAM838 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41061, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32267] Another function of VGAM838 is therefore inhibition of LOC149706 (Accession XM\_097718). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC150208 (Accession XM\_097841) is another VGAM838 host target gene. LOC150208 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150208 BINDING SITE, designated SEQ ID:41156, to

the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32268] Another function of VGAM838 is therefore inhibition of LOC150208 (Accession XM\_097841). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150208. LOC157653 (Accession XM\_088353) is another VGAM838 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39630, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32269] Another function of VGAM838 is therefore inhibition of LOC157653 (Accession XM\_088353). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC221495 (Accession XM\_168136) is another VGAM838 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:45057, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32270] Another function of VGAM838 is therefore inhibition of LOC221495 (Accession XM\_168136). Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC221747 (Accession XM\_166460) is another VGAM838 host target gene. LOC221747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221747 BINDING SITE, designated SEQ ID:44365, to the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, also designated SEQ ID:3549.

[32271] Another function of VGAM838 is therefore inhibition of LOC221747 (Accession XM\_166460). Accordingly, utilities

of VGAM838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221747. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 839 (VGAM839) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32272] VGAM839 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM839 was detected is described hereinabove with reference to Figs. 1–8.

[32273] VGAM839 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32274] VGAM839 gene encodes a VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM839 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM839 precursor RNA is designated SEQ ID:825, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:825 is located at position 208402 relative to the genome of Fowlpox Virus.

[32275] VGAM839 precursor RNA folds onto itself, forming VGAM839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32276] An enzyme complex designated DICER COMPLEX, `dices` the VGAM839 folded precursor RNA into VGAM839 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM839 RNA is designated SEQ ID:3550, and

is provided hereinbelow with reference to the sequence listing part.

[32277] VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM839 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32278] VGAM839 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM839 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM839 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32279] The complementary binding of VGAM839 RNA, herein designated VGAM RNA, to host target binding sites on VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM839 host target RNA into VGAM839 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32280] It is appreciated that VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM839 host target genes. The mRNA of each one of this plurality of VGAM839 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM839 RNA, herein designated VGAM RNA, and which when bound by VGAM839 RNA causes inhibition of translation of respective one or more VGAM839 host target proteins.

[32281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM839 gene, herein designated VGAM GENE, on one or more VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32282] It is yet further appreciated that a function of VGAM839 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM839 correlate with, and may be deduced from, the identity of the host target genes which VGAM839 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32283] Nucleotide sequences of the VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM839 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM839 are further described hereinbelow with reference to Table 1.

[32284] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM839 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM839 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32285] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM839 gene, herein designated VGAM is inhibition of expression of VGAM839 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM839 correlate with, and may be deduced from, the identity of the target genes which VGAM839 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32286] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_019900) is a VGAM839 host target gene. ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3, designated SEQ ID:21281, SEQ ID:21285 and SEQ ID:11437 respectively, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32287] A function of VGAM839 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_019900), a gene which may par-

ticipate directly in the active transport of drugs into sub-cellular organelles or influence drug distribution indirectly. Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC1. The function of ABCC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM479. Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883) is another VGAM839 host target gene. CRHR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:7610, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32288] Another function of VGAM839 is therefore inhibition of Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883), a gene which is a corticotropin releasing factor receptor type II. Accordingly, utilities of

VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR2.

The function of CRHR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737.T-complex 10 (mouse) (TCP10, Accession NM\_004610) is another VGAM839 host target gene.

TCP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCP10 BINDING SITE, designated SEQ ID:10950, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32289] Another function of VGAM839 is therefore inhibition of T-complex 10 (mouse) (TCP10, Accession NM\_004610). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCP10. ARPP-19 (Accession NM\_006628) is another VGAM839 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13422, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32290] Another function of VGAM839 is therefore inhibition of ARPP-19 (Accession NM\_006628). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. DKFZP586C1619 (Accession XM\_030350) is another VGAM839 host target gene. DKFZP586C1619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586C1619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586C1619 BINDING SITE, designated SEQ ID:31016, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32291] Another function of VGAM839 is therefore inhibition of

DKFZP586C1619 (Accession XM\_030350). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1619. Double C2-like Domains, Beta (DOC2B, Accession NM\_003585) is another VGAM839 host target gene. DOC2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOC2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOC2B BINDING SITE, designated SEQ ID:9637, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32292] Another function of VGAM839 is therefore inhibition of Double C2-like Domains, Beta (DOC2B, Accession NM\_003585). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOC2B. HSA243666 (Accession NM\_017582) is another VGAM839 host target gene. HSA243666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA243666, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA243666 BINDING SITE, designated SEQ ID:19021, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32293] Another function of VGAM839 is therefore inhibition of HSA243666 (Accession NM\_017582). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA243666. KIAA0172 (Accession XM\_036295) is another VGAM839 host target gene. KIAA0172 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0172 BINDING SITE, designated SEQ ID:32408, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32294] Another function of VGAM839 is therefore inhibition of KIAA0172 (Accession XM\_036295). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0172. MGC15563 (Accession NM\_032876) is another VGAM839 host target gene. MGC15563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15563 BINDING SITE, designated SEQ ID:26698, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32295] Another function of VGAM839 is therefore inhibition of MGC15563 (Accession NM\_032876). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15563. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564) is another VGAM839 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3

BINDING SITE, designated SEQ ID:29361, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32296] Another function of VGAM839 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. LOC145508 (Accession XM\_085158) is another VGAM839 host target gene. LOC145508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145508 BINDING SITE, designated SEQ ID:37886, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32297] Another function of VGAM839 is therefore inhibition of LOC145508 (Accession XM\_085158). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145508. LOC220753 (Accession XM\_167549) is an-

other VGAM839 host target gene. LOC220753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220753 BINDING SITE, designated SEQ ID:44659, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32298] Another function of VGAM839 is therefore inhibition of LOC220753 (Accession XM\_167549). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220753. LOC92078 (Accession XM\_042684) is another VGAM839 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33746, to the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, also designated SEQ ID:3550.

[32299] Another function of VGAM839 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 840 (VGAM840) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32300] VGAM840 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM840 was detected is described hereinabove with reference to Figs. 1–8.

[32301] VGAM840 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32302] VGAM840 gene encodes a VGAM840 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM840

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM840 precursor RNA is designated SEQ ID:826, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:826 is located at position 53374 relative to the genome of Ictalurid Herpesvirus 1.

[32303] VGAM840 precursor RNA folds onto itself, forming VGAM840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32304] An enzyme complex designated DICER COMPLEX, `dices` the VGAM840 folded precursor RNA into VGAM840 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM840 RNA is designated SEQ ID:3551, and is provided hereinbelow with reference to the sequence listing part.

[32305] VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM840 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32306] VGAM840 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM840 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM840 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32307] The complementary binding of VGAM840 RNA, herein designated VGAM RNA, to host target binding sites on VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM840 host target RNA into VGAM840 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32308] It is appreciated that VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM840 host target genes. The mRNA of each one of this plurality of VGAM840 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM840 RNA, herein designated VGAM RNA, and which when bound by VGAM840 RNA causes inhibition of translation of respective one or more VGAM840 host target proteins.

[32309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM840 gene, herein designated VGAM GENE, on one or more VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32310] It is yet further appreciated that a function of VGAM840 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM840 correlate with, and may be deduced from, the identity of the host target genes which VGAM840 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32311] Nucleotide sequences of the VGAM840 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM840 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM840 are further described hereinbelow with reference to Table 1.

[32312] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM840 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM840 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[32313] As mentioned hereinabove with reference to Fig. 1, a function of VGAM840 gene, herein designated VGAM is inhibition of expression of VGAM840 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM840 correlate with, and may be deduced from, the identity of the target genes which VGAM840 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32314] Recombination Activating Gene 1 (RAG1, Accession NM\_000448) is a VGAM840 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6039, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32315] A function of VGAM840 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM\_000448). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RAG1. Transmembrane Protein 1 (TMEM1, Accession NM\_003274) is another VGAM840 host target gene. TMEM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM1 BINDING SITE, designated SEQ ID:9289, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32316] Another function of VGAM840 is therefore inhibition of Transmembrane Protein 1 (TMEM1, Accession NM\_003274). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM1. Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912) is another VGAM840 host target gene. TRIM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM8 BINDING SITE,

designated SEQ ID:25180, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32317] Another function of VGAM840 is therefore inhibition of Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM8. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM\_020162) is another VGAM840 host target gene. DDX33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX33 BINDING SITE, designated SEQ ID:21378, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32318] Another function of VGAM840 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM\_020162). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with DDX33. DKFZP586M1120 (Accession NM\_031294) is another VGAM840 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25324, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32319] Another function of VGAM840 is therefore inhibition of DKFZP586M1120 (Accession NM\_031294). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. KIAA0237 (Accession NM\_014747) is another VGAM840 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0237 BINDING SITE, designated SEQ ID:16442, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32320] Another function of VGAM840 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0711 (Accession NM\_014867) is another VGAM840 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16956, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32321] Another function of VGAM840 is therefore inhibition of KIAA0711 (Accession NM\_014867). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. VLCS-H1 (Accession NM\_014031) is another VGAM840 host target gene. VLCS-H1 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VLCS-H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VLCS-H1 BINDING SITE, designated SEQ ID:15261, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32322] Another function of VGAM840 is therefore inhibition of VLCS-H1 (Accession NM\_014031). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLCS-H1. LOC147138 (Accession XM\_085717) is another VGAM840 host target gene. LOC147138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147138 BINDING SITE, designated SEQ ID:38308, to the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, also designated SEQ ID:3551.

[32323] Another function of VGAM840 is therefore inhibition of

LOC147138 (Accession XM\_085717). Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147138. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 841 (VGAM841) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32324] VGAM841 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM841 was detected is described hereinabove with reference to Figs. 1–8.

[32325] VGAM841 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32326] VGAM841 gene encodes a VGAM841 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM841 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM841 precursor RNA is designated SEQ ID:827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:827 is located at position 161925 relative to the genome of Equine Herpesvirus 2.

[32327] VGAM841 precursor RNA folds onto itself, forming VGAM841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32328] An enzyme complex designated DICER COMPLEX, `dices` the VGAM841 folded precursor RNA into VGAM841 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide se-

quence of VGAM841 RNA is designated SEQ ID:3552, and is provided hereinbelow with reference to the sequence listing part.

[32329] VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM841 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32330] VGAM841 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM841 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM841 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32331] The complementary binding of VGAM841 RNA, herein designated VGAM RNA, to host target binding sites on VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM841 host target RNA into VGAM841 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32332] It is appreciated that VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM841 host target genes. The mRNA of each one of this plurality of VGAM841 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM841 RNA, herein designated VGAM RNA, and which when bound by VGAM841 RNA causes inhibition of translation of respective one or more VGAM841 host target proteins.

[32333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM841 gene, herein designated VGAM GENE, on one or more VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32334] It is yet further appreciated that a function of VGAM841 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM841 correlate with, and may be deduced from, the identity of the host target genes which VGAM841 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32335] Nucleotide sequences of the VGAM841 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM841 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM841 are further described hereinbelow with reference to Table 1.

[32336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM841 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM841 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32337] As mentioned hereinabove with reference to Fig. 1, a function of VGAM841 gene, herein designated VGAM is inhibition of expression of VGAM841 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM841 correlate with, and may be deduced from, the identity of the target genes which VGAM841 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32338] Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041) is a VGAM841 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22562, to the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, also designated SEQ ID:3552.

[32339] A function of VGAM841 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM606. Golgi Autoantigen, Golgin Subfamily A, 4 (GOLGA4, Accession XM\_011069) is another VGAM841 host target gene. GOLGA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GOLGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA4 BINDING SITE, designated SEQ ID:30164, to the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, also designated SEQ ID:3552.

[32340] Another function of VGAM841 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 4 (GOLGA4, Accession XM\_011069), a gene which may play a role in vesicular transport from the trans- golgi. Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA4. The function of GOLGA4 has been established by previous studies. To characterize the Golgi com-

plex, Kooy et al. (1992) used serum from a Sjogren syndrome (OMIM Ref. No. 270150) patient with a high titer of anti-Golgi autoantibodies. The serum immunoprecipitated a 230-kD protein that was specifically localized to the cytosolic surface of what is probably the trans-face of the Golgi stack. The 230-kD Golgi protein appears to be a peripheral membrane component. The authors detected the 230-kD antigen in several cell types and species. By screening a HeLa cell cDNA expression library with the anti-Golgi autoantibodies, Erlich et al. (1996) identified a p230 cDNA. The 7.7-kb p230 mRNA encodes a 2,230-amino acid protein with a predicted coiled-coil structure, stabilized by heptad repeats. The p230 protein also contains a granin motif (see OMIM Ref. No. 113705). By SDS-PAGE, p230 from HeLa cells migrates as a 230-kD protein. Daigo et al. (1999) found that the trans-Golgi gene contains at least 11 exons. Independently, Fritzler et al. (1995) cloned a partial GOLGA4 cDNA using serum from a Sjogren syndrome patient. Based on its predicted molecular mass, they designated the GOLGA4 protein 'golgin-245.'

[32341] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [32342] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.; Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.; Nakamura, Y. : Characterization of a 1200-kb genomic segment of chromosome 3p22–p21.3. DNA Res. 6: 37–44, 1999. ; and

- [32344] Further studies establishing the function and utilities of GOLGA4 are found in John Hopkins OMIM database record ID 602509, and in cited publications numbered 9037–9038, 853 and 8544 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM\_016138) is another VGAM841 host target gene. COQ7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COQ7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of COQ7 BINDING SITE, designated SEQ ID:18223, to the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, also designated SEQ ID:3552.

[32345] Another function of VGAM841 is therefore inhibition of Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM\_016138). Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COQ7. FLJ20136 (Accession NM\_017684) is another VGAM841 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19229, to the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, also designated SEQ ID:3552.

[32346] Another function of VGAM841 is therefore inhibition of FLJ20136 (Accession NM\_017684). Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136.

G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756) is another VGAM841 host target gene. GPR64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR64 BINDING SITE, designated SEQ ID:12315, to the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, also designated SEQ ID:3552.

[32347] Another function of VGAM841 is therefore inhibition of G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756). Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR64. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 842 (VGAM842) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32348] VGAM842 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM842 was detected is described hereinabove with reference to Figs. 1–8.

[32349] VGAM842 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32350] VGAM842 gene encodes a VGAM842 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM842 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM842 precursor RNA is designated SEQ ID:828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:828 is located at position 161225 relative to the genome of Equine Herpesvirus 2.

[32351] VGAM842 precursor RNA folds onto itself, forming VGAM842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32352] An enzyme complex designated DICER COMPLEX, `dices` the VGAM842 folded precursor RNA into VGAM842 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM842 RNA is designated SEQ ID:3553, and is provided hereinbelow with reference to the sequence listing part.

[32353] VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM842 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32354] VGAM842 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM842 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM842 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32355] The complementary binding of VGAM842 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM842 host target RNA into VGAM842 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32356] It is appreciated that VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM842 host target genes. The mRNA of each one of this plurality of VGAM842 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM842 RNA, herein designated VGAM RNA, and which when bound by VGAM842 RNA causes inhibition of translation of respective one or more VGAM842 host target proteins.

[32357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM842 gene, herein designated VGAM GENE, on one or more VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32358] It is yet further appreciated that a function of VGAM842 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM842 correlate with, and may be deduced from, the identity of the host target genes which VGAM842 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32359] Nucleotide sequences of the VGAM842 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM842 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM842 are further described hereinbelow with reference to Table 1.

[32360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM842 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM842 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32361] As mentioned hereinabove with reference to Fig. 1, a function of VGAM842 gene, herein designated VGAM is inhibition of expression of VGAM842 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM842 correlate with, and may be deduced from, the identity of the target genes which VGAM842 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32362] Adrenomedullin (ADM, Accession NM\_001124) is a VGAM842 host target gene. ADM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by ADM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADM BINDING SITE, designated SEQ ID:6795, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32363] A function of VGAM842 is therefore inhibition of Adrenomedullin (ADM, Accession NM\_001124), a gene which regulates blood pressure and heart rate. Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADM. The function of ADM has been established by previous studies. Adrenomedullin, a hypotensive peptide found in human pheochromocytoma, consists of 52 amino acids, has 1 intramolecular disulfide bond, and shows slight homology with the calcitonin gene-related peptide (CGRP; 114130). It may function as a hormone in circulation control because it is found in blood in a considerable concentration. Kitamura et al. (1993) constructed a cDNA library of pheochromocytoma and isolated therefrom a cDNA clone encoding an adrenomedullin precursor. The precursor, called preproa-

drenomedullin, is 185 amino acids long. By RNA-blot analysis, human adrenomedullin mRNA was found to be highly expressed in several tissues, including adrenal medulla, cardiac ventricle, lung, and kidney, as well as pheochromocytoma. By Southern blot analyses of human/hamster somatic hybrid cell lines, Ishimitsu et al. (1994) demonstrated that the ADM gene is represented by a single locus on chromosome 11. Okazaki et al. (1996) mapped the Adm gene to the distal region of mouse chromosome 7, a region that shows syntenic homology to human 11p15-q13; the human ADM gene is probably located at 11p15.4 (van Heyningen and Jones, 1993). Animal model experiments lend further support to the function of ADM. To elucidate the functions of adrenomedullin, Caron and Smithies (2001) replaced the coding region of the Adm gene in mice with a sequence encoding enhanced green fluorescent protein while leaving the Adm promoter intact.

[32364] It is appreciated that the abovementioned animal model for ADM is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[32365] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [32366] Kitamura, K.; Sakata, J.; Kangawa, K.; Kojima, M.; Matsuo, H.; Eto, T. : Cloning and characterization of cDNA encoding a precursor for human adrenomedullin. *Biochem. Biophys. Res. Commun.* 194: 720–725, 1993. ; and
- [32367] Caron, K. M.; Smithies, O. : Extreme hydrops fetalis and cardiovascular abnormalities in mice lacking a functional adrenomedullin gene. *Proc. Nat. Acad. Sci.* 98: 615–619, 2001.
- [32368] Further studies establishing the function and utilities of ADM are found in John Hopkins OMIM database record ID 103275, and in cited publications numbered 4298–4306 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin 12, Type 2 (N-cadherin 2) (CDH12, Accession NM\_004061) is another VGAM842 host target gene. CDH12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDH12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH12 BINDING SITE, designated SEQ ID:10267, to the nucleotide se-

quence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32369] Another function of VGAM842 is therefore inhibition of Cadherin 12, Type 2 (N-cadherin 2) (CDH12, Accession NM\_004061). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH12. Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493) is another VGAM842 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13229, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32370] Another function of VGAM842 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502) is an-

other VGAM842 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34978, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32371] Another function of VGAM842 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM\_166312) is another VGAM842 host target gene. MAN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1A1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1A1 BINDING SITE, designated SEQ ID:44134, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32372] Another function of VGAM842 is therefore inhibition of Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM\_166312), a gene which removes 3 distinct mannose residues from peptide-bound Man(9)-GlcNAc(2) oligosaccharides. Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1A1. The function of MAN1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Protein Tyrosine Phosphatase, Receptor Type, N (PTPRN, Accession NM\_002846) is another VGAM842 host target gene. PTPRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PTPRN BINDING SITE, designated SEQ ID:8735, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32373] Another function of VGAM842 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N (PTPRN, Accession NM\_002846). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN. Secretogranin III (SCG3, Accession NM\_013243) is another VGAM842 host target gene. SCG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCG3 BINDING SITE, designated SEQ ID:14900, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32374] Another function of VGAM842 is therefore inhibition of Secretogranin III (SCG3, Accession NM\_013243). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SCG3. Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011) is another VGAM842 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15227, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32375] Another function of VGAM842 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. ABLIM (Accession NM\_002313) is another VGAM842 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM

BINDING SITE2, designated SEQ ID:8118 and SEQ ID:13551 respectively, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32376] Another function of VGAM842 is therefore inhibition of ABLIM (Accession NM\_002313). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. DKFZp434O0320 (Accession XM\_097012) is another VGAM842 host target gene. DKFZp434O0320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434O0320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0320 BINDING SITE, designated SEQ ID:40705, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32377] Another function of VGAM842 is therefore inhibition of DKFZp434O0320 (Accession XM\_097012). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp434O0320. FLJ11040 (Accession NM\_018307) is another VGAM842 host target gene. FLJ11040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11040 BINDING SITE, designated SEQ ID:20295, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32378] Another function of VGAM842 is therefore inhibition of FLJ11040 (Accession NM\_018307). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11040. HYPH (Accession XM\_170722) is another VGAM842 host target gene. HYPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HYPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYPH BINDING SITE, designated SEQ ID:45482, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ

ID:3553.

[32379] Another function of VGAM842 is therefore inhibition of HYPH (Accession XM\_170722). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPH. KIAA0261 (Accession XM\_042946) is another VGAM842 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33832, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32380] Another function of VGAM842 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. KIAA0937 (Accession XM\_166213) is another VGAM842 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44016, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32381] Another function of VGAM842 is therefore inhibition of KIAA0937 (Accession XM\_166213). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. KIAA1091 (Accession XM\_045750) is another VGAM842 host target gene. KIAA1091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1091 BINDING SITE, designated SEQ ID:34541, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32382] Another function of VGAM842 is therefore inhibition of KIAA1091 (Accession XM\_045750). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1091. KIAA1576 (Accession XM\_038186) is another VGAM842 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32773, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32383] Another function of VGAM842 is therefore inhibition of KIAA1576 (Accession XM\_038186). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM\_005930) is another VGAM842 host target gene. MGEA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA6 BINDING

SITE, designated SEQ ID:12561, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32384] Another function of VGAM842 is therefore inhibition of Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM\_005930). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA6. NYD-SP20 (Accession NM\_032598) is another VGAM842 host target gene. NYD-SP20 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NYD-SP20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP20 BINDING SITE, designated SEQ ID:26329, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32385] Another function of VGAM842 is therefore inhibition of NYD-SP20 (Accession NM\_032598). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP20. Sema Domain, Seven Thrombospondin Repeats

(type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966) is another VGAM842 host target gene. SEMA5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA5A BINDING SITE, designated SEQ ID:10105, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32386] Another function of VGAM842 is therefore inhibition of Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA5A. LOC151473 (Accession XM\_087215) is another VGAM842 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39122, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32387] Another function of VGAM842 is therefore inhibition of LOC151473 (Accession XM\_087215). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC219594 (Accession XM\_165451) is another VGAM842 host target gene. LOC219594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219594 BINDING SITE, designated SEQ ID:43640, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32388] Another function of VGAM842 is therefore inhibition of LOC219594 (Accession XM\_165451). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC219594. LOC219673 (Accession XM\_167567) is another VGAM842 host target gene. LOC219673 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:44693, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32389] Another function of VGAM842 is therefore inhibition of LOC219673 (Accession XM\_167567). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219673. LOC221466 (Accession XM\_168087) is another VGAM842 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44993, to

the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32390] Another function of VGAM842 is therefore inhibition of LOC221466 (Accession XM\_168087). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC221477 (Accession XM\_166397) is another VGAM842 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44258, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32391] Another function of VGAM842 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC253820 (Accession XM\_171040) is another VGAM842 host target gene. LOC253820 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC253820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253820 BINDING SITE, designated SEQ ID:45808, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32392] Another function of VGAM842 is therefore inhibition of LOC253820 (Accession XM\_171040). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253820. LOC257282 (Accession XM\_172844) is another VGAM842 host target gene. LOC257282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257282 BINDING SITE, designated SEQ ID:46121, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32393] Another function of VGAM842 is therefore inhibition of LOC257282 (Accession XM\_172844). Accordingly, utilities

of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257282. LOC90333 (Accession XM\_030958) is another VGAM842 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31225, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32394] Another function of VGAM842 is therefore inhibition of LOC90333 (Accession XM\_030958). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC91547 (Accession XM\_039093) is another VGAM842 host target gene. LOC91547 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91547 BINDING SITE, designated SEQ ID:33003, to the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, also designated SEQ ID:3553.

[32395] Another function of VGAM842 is therefore inhibition of LOC91547 (Accession XM\_039093). Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91547. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 843 (VGAM843) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32396] VGAM843 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM843 was detected is described hereinabove with reference to Figs. 1–8.

[32397] VGAM843 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32398] VGAM843 gene encodes a VGAM843 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM843 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM843 precursor RNA is designated SEQ ID:829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:829 is located at position 120975 relative to the genome of Monkeypox Virus.

[32399] VGAM843 precursor RNA folds onto itself, forming VGAM843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32400] An enzyme complex designated DICER COMPLEX, `dices` the VGAM843 folded precursor RNA into VGAM843 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM843 RNA is designated SEQ ID:3554, and is provided hereinbelow with reference to the sequence listing part.

[32401] VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM843 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32402] VGAM843 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM843 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM843 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32403] The complementary binding of VGAM843 RNA, herein designated VGAM RNA, to host target binding sites on VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM843 host target RNA into VGAM843 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32404] It is appreciated that VGAM843 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM843 host target genes. The mRNA of each one of this plurality of VGAM843 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM843 RNA, herein designated VGAM RNA, and which when bound by VGAM843 RNA causes inhibition of translation of respective one or more VGAM843 host target proteins.

[32405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM843 gene, herein designated VGAM GENE, on one or more VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[32406] It is yet further appreciated that a function of VGAM843 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM843 correlate with, and may be deduced from, the identity of the host target genes which VGAM843 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32407] Nucleotide sequences of the VGAM843 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM843 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM843 are further described hereinbelow with reference to Table 1.

[32408] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM843 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM843 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32409] As mentioned hereinabove with reference to Fig. 1, a function of VGAM843 gene, herein designated VGAM is inhibition of expression of VGAM843 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM843 correlate with, and may be deduced from, the identity of the target genes which VGAM843 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32410] Butyrylcholinesterase (BCHE, Accession NM\_000055) is a VGAM843 host target gene. BCHE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCHE BINDING SITE, designated SEQ ID:5512, to the nucleotide sequence of VGAM843 RNA, herein designated VGAM RNA, also designated SEQ ID:3554.

[32411] A function of VGAM843 is therefore inhibition of Butyryl-

cholinesterase (BCHE, Accession NM\_000055). Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCHE. Ankyrin Repeat Domain 6 (ANKRD6, Accession NM\_014942) is another VGAM843 host target gene. ANKRD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKRD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKRD6 BINDING SITE, designated SEQ ID:17250, to the nucleotide sequence of VGAM843 RNA, herein designated VGAM RNA, also designated SEQ ID:3554.

[32412] Another function of VGAM843 is therefore inhibition of Ankyrin Repeat Domain 6 (ANKRD6, Accession NM\_014942). Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD6. CSE-C (Accession XM\_166163) is another VGAM843 host target gene. CSE-C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSE-C, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSE-C BINDING SITE, designated SEQ ID:43979, to the nucleotide sequence of VGAM843 RNA, herein designated VGAM RNA, also designated SEQ ID:3554.

[32413] Another function of VGAM843 is therefore inhibition of CSE-C (Accession XM\_166163). Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE-C. LOC145009 (Accession XM\_016472) is another VGAM843 host target gene. LOC145009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145009 BINDING SITE, designated SEQ ID:30262, to the nucleotide sequence of VGAM843 RNA, herein designated VGAM RNA, also designated SEQ ID:3554.

[32414] Another function of VGAM843 is therefore inhibition of LOC145009 (Accession XM\_016472). Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145009. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 844 (VGAM844) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32415] VGAM844 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM844 was detected is described hereinabove with reference to Figs. 1–8.

[32416] VGAM844 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32417] VGAM844 gene encodes a VGAM844 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM844 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM844 precursor RNA is designated SEQ ID:830, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:830 is located at position 121671 relative to the genome of Monkeypox Virus.

[32418] VGAM844 precursor RNA folds onto itself, forming VGAM844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32419] An enzyme complex designated DICER COMPLEX, `dices` the VGAM844 folded precursor RNA into VGAM844 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM844 RNA is designated SEQ ID:3555, and is provided hereinbelow with reference to the sequence listing part.

[32420] VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM844 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32421] VGAM844 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM844 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM844 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32422] The complementary binding of VGAM844 RNA, herein designated VGAM RNA, to host target binding sites on VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM844 host target RNA into VGAM844 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32423] It is appreciated that VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM844 host target genes. The mRNA of each one of this plurality of VGAM844 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM844 RNA, herein designated VGAM RNA, and which when bound by VGAM844 RNA causes in-

hibition of translation of respective one or more VGAM844 host target proteins.

[32424] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM844 gene, herein designated VGAM GENE, on one or more VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32425] It is yet further appreciated that a function of VGAM844 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM844 include diagnosis, prevention and

treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM844 correlate with, and may be deduced from, the identity of the host target genes which VGAM844 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [32426] Nucleotide sequences of the VGAM844 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM844 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM844 are further described hereinbelow with reference to Table 1.
- [32427] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM844 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM844 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [32428] As mentioned hereinabove with reference to Fig. 1, a function of VGAM844 gene, herein designated VGAM is inhibition of expression of VGAM844 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM844 correlate with, and may be deduced from, the identity of the target genes which VGAM844 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32429] LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547) is a VGAM844 host target gene. LATS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LATS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LATS1 BINDING SITE, designated SEQ ID:30237, to the nucleotide sequence of VGAM844 RNA, herein designated VGAM RNA, also designated SEQ ID:3555.

[32430] A function of VGAM844 is therefore inhibition of LATS, Large Tumor Suppressor, Homolog 1 (Drosophila) (LATS1, Accession XM\_015547). Accordingly, utilities of VGAM844 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LATS1. SCDGF-B (Accession NM\_025208) is another VGAM844 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING

SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:24877 and SEQ ID:26979 respectively, to the nucleotide sequence of VGAM844 RNA, herein designated VGAM RNA, also designated SEQ ID:3555.

[32431] Another function of VGAM844 is therefore inhibition of SCDGF-B (Accession NM\_025208). Accordingly, utilities of VGAM844 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713) is another VGAM845 host target gene. SDCCAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG1 BINDING SITE, designated SEQ ID:11069, to the nucleotide sequence of VGAM845 RNA, herein designated VGAM RNA, also designated SEQ

ID:3556.

[32432] Another function of VGAM845 is therefore inhibition of Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713). Accordingly, utilities of VGAM845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 846 (VGAM846) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32433] VGAM846 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM846 was detected is described hereinabove with reference to Figs. 1–8.

[32434] VGAM846 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32435] VGAM846 gene encodes a VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM846 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM846 precursor RNA is designated SEQ ID:832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:832 is located at position 132582 relative to the genome of Gallid Herpesvirus 2.

[32436] VGAM846 precursor RNA folds onto itself, forming VGAM846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32437] An enzyme complex designated DICER COMPLEX, `dices` the VGAM846 folded precursor RNA into VGAM846 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM846 RNA is designated SEQ ID:3557, and is provided hereinbelow with reference to the sequence listing part.

[32438] VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM846 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[32439] VGAM846 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM846 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM846 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32440] The complementary binding of VGAM846 RNA, herein designated VGAM RNA, to host target binding sites on VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM846 host target RNA into VGAM846 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32441] It is appreciated that VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM846 host target genes. The mRNA of

each one of this plurality of VGAM846 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM846 RNA, herein designated VGAM RNA, and which when bound by VGAM846 RNA causes inhibition of translation of respective one or more VGAM846 host target proteins.

[32442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM846 gene, herein designated VGAM GENE, on one or more VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32443] It is yet further appreciated that a function of VGAM846 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM846 correlate with, and may be deduced from, the identity of the host target genes which VGAM846 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32444] Nucleotide sequences of the VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM846 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM846 are further described hereinbelow with reference to Table 1.

[32445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM846 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM846 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32446] As mentioned hereinabove with reference to Fig. 1, a function of VGAM846 gene, herein designated VGAM is inhibition of expression of VGAM846 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM846 correlate with, and may be deduced from, the identity of the target genes which VGAM846 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32447] Aconitase 1, Soluble (ACO1, Accession NM\_002197) is a VGAM846 host target gene. ACO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACO1 BINDING SITE, designated SEQ ID:7953, to the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, also designated SEQ ID:3557.

[32448] A function of VGAM846 is therefore inhibition of Aconitase 1, Soluble (ACO1, Accession NM\_002197), a gene which an iron-dependent enzyme; catalyzes conversion of

citrate to cis-aconitate in the TCA cycle. Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACO1. The function of ACO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Annexin A7 (ANXA7, Accession NM\_004034) is another VGAM846 host target gene. ANXA7 BINDING SITE1 and ANXA7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANXA7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA7 BINDING SITE1 and ANXA7 BINDING SITE2, designated SEQ ID:10253 and SEQ ID:6824 respectively, to the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, also designated SEQ ID:3557.

[32449] Another function of VGAM846 is therefore inhibition of Annexin A7 (ANXA7, Accession NM\_004034), a gene which promotes membrane fusion and is involved in exocytosis. Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ANXA7. The function of ANXA7 has been established by previous studies. The ANX7 gene is located on chromosome 10q21, a site long hypothesized to harbor a tumor suppressor gene or genes associated with prostate and other cancers. To test this hypothesis, Srivastava et al. (2001) analyzed the action of the ANX7 gene on colony formation by human tumor cell lines. They also examined the expression of the ANX7 protein in a large number of prostate cancers using tumor tissue microarray technology. Finally, they tested a panel of primary and metastatic prostate cancers for evidence of loss of heterozygosity (LOH). They found that human tumor cell proliferation and colony formation were markedly reduced when the wildtype ANX7 gene was transfected into 2 prostate tumor cell lines. Consistently, analysis of ANX7 protein expression in human prostate tumor microarrays revealed a significantly higher rate of loss of ANX7 expression in metastatic and local recurrences of hormone refractory prostate cancer as compared with primary tumors ( $P = 0.0001$ ). Using 4 microsatellite markers at or near the ANX7 locus and laser capture microdissected tumor cells, 35% of 20 primary prostate tumors showed LOH. The microsatellite marker closest to the

ANX7 locus showed the highest rate of LOH, including 1 homozygous deletion. Srivastava et al. (2001) concluded that the ANX7 gene exhibits many biologic and genetic properties expected of a tumor suppressor gene and may play a role in prostate cancer progression. Animal model experiments lend further support to the function of ANXA7. By gene targeting, Srivastava et al. (1999) developed Anxa7-null mice. The null phenotype was lethal at embryonic day 10. Heterozygous mice were viable and fertile, but showed a defect in insulin secretion and an increased insulin content within isolated pancreatic islets. Electrooptical recordings suggested that the mutation altered  $\text{Ca}^{2+}$  release by agonists of inositol trisphosphate. Using mice with a different genetic background and an alternate strategy to introduce the null mutation, Herr et al. (2001) developed Anxa7  $-/-$  mice that were viable, fertile, and showed no obvious defects. Analysis of insulin secretion from isolated islets revealed no evidence for the involvement of Anxa7 in  $\text{Ca}^{2+}$ -dependent or cAMP-mediated exocytosis. In cardiomyocytes, however, they found a functional role for Anxa7 in electromechanical coupling. Cardiomyocytes from embryonic Anxa7-null mice displayed intact  $\text{Ca}^{2+}$  homeostasis and unremark-

able excitation–contraction coupling; however, adult Anxa7  $-/-$  mice exhibited a decrease in frequency–induced cell shortening.

[32450] It is appreciated that the abovementioned animal model for ANXA7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[32451] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32452] Srivastava, M.; Atwater, I.; Glasman, M.; Leighton, X.; Goping, G.; Caohuy, H.; Miller, G.; Pichel, J.; Westphal, H.; Mears, D.; Rojas, E.; Pollard, H. B. : Defects in inositol 1,4,5–trisphosphate receptor expression,  $Ca^{2+}$  signaling, and insulin secretion in the anx7(+/-) knockout mouse. Proc. Nat. Acad. Sci. 96: 13783–13788, 1999. ; and

[32453] Srivastava, M.; Bubendorf, L.; Srikantan, V.; Fossom, L.; Nolan, L.; Glasman, M.; Leighton, X.; Fehrle, W.; Pittaluga, S.; Raffeld, M.; Koivisto, P.; Willi, N.; Gasser, T. C.; Kononen.

[32454] Further studies establishing the function and utilities of ANXA7 are found in John Hopkins OMIM database record

ID 186360, and in cited publications numbered 10507–10514 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1729 (Accession XM\_114418) is another VGAM846 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42946, to the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, also designated SEQ ID:3557.

[32455] Another function of VGAM846 is therefore inhibition of KIAA1729 (Accession XM\_114418). Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. PRO1575 (Accession NM\_014092) is another VGAM846 host target gene. PRO1575 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1575, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRO1575 BINDING SITE, designated SEQ ID:15311, to the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, also designated SEQ ID:3557.

[32456] Another function of VGAM846 is therefore inhibition of PRO1575 (Accession NM\_014092). Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1575. LOC51339 (Accession NM\_016651) is another VGAM846 host target gene. LOC51339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51339 BINDING SITE, designated SEQ ID:18767, to the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, also designated SEQ ID:3557.

[32457] Another function of VGAM846 is therefore inhibition of LOC51339 (Accession NM\_016651). Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51339. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 847 (VGAM847) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32458] VGAM847 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM847 was detected is described hereinabove with reference to Figs. 1–8.

[32459] VGAM847 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32460] VGAM847 gene encodes a VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM847 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM847 precursor RNA is designated SEQ ID:833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:833 is

located at position 132873 relative to the genome of Gal-  
lid Herpesvirus 2.

[32461] VGAM847 precursor RNA folds onto itself, forming VGAM847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32462] An enzyme complex designated DICER COMPLEX, `dices` the VGAM847 folded precursor RNA into VGAM847 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM847 RNA is designated SEQ ID:3558, and is provided hereinbelow with reference to the sequence listing part.

[32463] VGAM847 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM847 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32464] VGAM847 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM847 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM847 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM847 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[32465] The complementary binding of VGAM847 RNA, herein designated VGAM RNA, to host target binding sites on VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM847 host target RNA into VGAM847 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32466] It is appreciated that VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM847 host target genes. The mRNA of each one of this plurality of VGAM847 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM847 RNA, herein designated VGAM RNA, and which when bound by VGAM847 RNA causes inhibition of translation of respective one or more VGAM847

host target proteins.

[32467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM847 gene, herein designated VGAM GENE, on one or more VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32468] It is yet further appreciated that a function of VGAM847 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM847 correlate with, and may be deduced from, the identity of the host target genes which VGAM847 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32469] Nucleotide sequences of the VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM847 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM847 are further described hereinbelow with reference to Table 1.

[32470] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM847 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM847 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32471] As mentioned hereinabove with reference to Fig. 1, a function of VGAM847 gene, herein designated VGAM is inhibition of expression of VGAM847 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM847 correlate with, and may be deduced from, the identity of the target genes which VGAM847 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32472] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM\_020038) is a VGAM847 host target gene. ABCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE, designated SEQ ID:21291, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32473] A function of VGAM847 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM\_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM505. Activin A Receptor, Type IB (ACVR1B, Accession NM\_004302) is another VGAM847 host target gene. ACVR1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACVR1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR1B BINDING SITE, designated SEQ ID:10512, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32474] Another function of VGAM847 is therefore inhibition of Activin A Receptor, Type IB (ACVR1B, Accession NM\_004302), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1B. The function of ACVR1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM208.BLTR2

(Accession NM\_019839) is another VGAM847 host target gene. BLTR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BLTR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLTR2 BINDING SITE, designated SEQ ID:21246, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32475] Another function of VGAM847 is therefore inhibition of BLTR2 (Accession NM\_019839). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLTR2. Immunoglobulin Superfamily, Member 8 (IGSF8, Accession NM\_052868) is another VGAM847 host target gene. IGSF8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IGSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGSF8 BINDING SITE, designated SEQ ID:27449, to the nucleotide sequence of VGAM847 RNA, herein designated

VGAM RNA, also designated SEQ ID:3558.

[32476] Another function of VGAM847 is therefore inhibition of Immunoglobulin Superfamily, Member 8 (IGSF8, Accession NM\_052868), a gene which inhibits the binding of prostaglandin f2-alpha to its specific fp receptor. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGSF8. The function of IGSF8 has been established by previous studies. Tetraspanins, such as CD81 (OMIM Ref. No. 186845), have 4 transmembrane domains and N- and C-terminal cytoplasmic regions and form extensive complexes, or webs, with other tetraspanins as well as with integrins, MHC molecules, and other proteins. The IGSF8 gene encodes a protein that forms highly proximal, specific, and stoichiometric complexes with CD81 and CD9 (OMIM Ref. No. 143030). By Brij-97 detergent lysis of a T cell line and immunoprecipitation with anti-CD81, micropeptide sequencing of the 75-kD protein, MALDI-TOF mass spectrometry, and PSD analysis, followed by database searching, Clark et al. (2001) obtained a cDNA encoding mouse Pgri ('prostaglandin regulatory-like') and the amino acid sequence of human PGRL (IGSF8). Sequence analysis predicted that the 613-amino acid Ig

superfamily protein, 90% identical to the mouse protein, possesses an N-terminal signal sequence, 4 Ig domains, 3 N-linked glycosylation sites, a transmembrane domain, and a short cytoplasmic tail. Genomic database analysis clustered PGRL into a family of proteins including IGSF2 (OMIM Ref. No. 604516), IGSF3 (OMIM Ref. No. 603491), and FPRP (OMIM Ref. No. 601204). Immunoprecipitation and mutation analysis indicated that CD81 interacts with PGRL containing all 4 Ig domains. Using Brij-96 detergent lysis of teratocarcinoma, embryonic kidney, and epithelial carcinoma cell lines and immunoprecipitation with anti-CD81, micropeptide sequencing of a 70-kD protein, and EST database searching, Stipp et al. (2001) isolated a cDNA encoding IGSF8, which they referred to as EWI2 ('glutamine-tryptophan-isoleucine-2'). Northern blot analysis of human tissues revealed expression of a 2.4-kb transcript with highest expression in brain, kidney, liver, and placenta, moderate expression in other tissues, and minimal expression in peripheral blood leukocytes. Immunoprecipitation and immunoblot analysis indicated that IGSF8, like FPRP, specifically associates highly stoichiometrically with CD81 and CD9, but not with other tetraspanins or integrins. Stipp et al. (2001) proposed that

IGSF8 may be a necessary cofactor for other CD9 and CD81 functions such as sperm-egg fusion or hepatitis C virus receptor function.

[32477] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32478] Clark, K. L; Zeng, Z.; Langford, A. L; Bowen, S. M; Todd, S. C. : PGRL is a major CD81-associated protein on lymphocytes and distinguishes a new family of cell surface proteins. J. Immun. 167: 5115-5121, 2001. ; and

[32479] Stipp, C. S.; Kolesnikova, T. V.; Hemler, M. E. : EWI-2 is a major CD9 and CD81 partner and member of a novel Ig protein subfamily. J. Biol. Chem. 276: 40545-40554, 2001.

[32480] Further studies establishing the function and utilities of IGSF8 are found in John Hopkins OMIM database record ID 606644, and in cited publications numbered 6125-6126 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipin 1 (LPIN1, Accession XM\_041136) is another VGAM847 host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BINDING SITE, designated SEQ ID:33469, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32481] Another function of VGAM847 is therefore inhibition of Lipin 1 (LPIN1, Accession XM\_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35.SH3-domain Binding Protein 4 (SH3BP4, Accession NM\_014521) is another VGAM847 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15854, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3558.

[32482] Another function of VGAM847 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM\_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is another VGAM847 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5925, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32483] Another function of VGAM847 is therefore inhibition of

Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. AFAP (Accession NM\_021638) is another VGAM847 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:22292, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32484] Another function of VGAM847 is therefore inhibition of AFAP (Accession NM\_021638). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656) is another VGAM847 host target gene. ARFD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARFD1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFD1 BINDING SITE, designated SEQ ID:7373, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32485] Another function of VGAM847 is therefore inhibition of ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFD1. ARNTL2 (Accession NM\_020183) is another VGAM847 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21417, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32486] Another function of VGAM847 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of

VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. Cytochrome P450, Subfamily IIS, Polypeptide 1 (CYP2S1, Accession NM\_030622) is another VGAM847 host target gene. CYP2S1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP2S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP2S1 BINDING SITE, designated SEQ ID:24964, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32487] Another function of VGAM847 is therefore inhibition of Cytochrome P450, Subfamily IIS, Polypeptide 1 (CYP2S1, Accession NM\_030622). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP2S1. F-box Only Protein 26 (FBXO26, Accession NM\_024907) is another VGAM847 host target gene. FBXO26 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FBXO26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO26 BINDING SITE, designated SEQ ID:24404, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32488] Another function of VGAM847 is therefore inhibition of F-box Only Protein 26 (FBXO26, Accession NM\_024907). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO26. FLJ12587 (Accession NM\_022480) is another VGAM847 host target gene. FLJ12587 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:22853, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32489] Another function of VGAM847 is therefore inhibition of FLJ12587 (Accession NM\_022480). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587.

FLJ20174 (Accession NM\_017699) is another VGAM847 host target gene. FLJ20174 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20174 BINDING SITE, designated SEQ ID:19272, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32490] Another function of VGAM847 is therefore inhibition of FLJ20174 (Accession NM\_017699). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20174. KIAA1396 (Accession XM\_032054) is another VGAM847 host target gene. KIAA1396 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:31548, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3558.

[32491] Another function of VGAM847 is therefore inhibition of KIAA1396 (Accession XM\_032054). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396. MGC2752 (Accession XM\_085842) is another VGAM847 host target gene. MGC2752 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2752 BINDING SITE, designated SEQ ID:38369, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32492] Another function of VGAM847 is therefore inhibition of MGC2752 (Accession XM\_085842). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2752. Neurexophilin 3 (NXPH3, Accession XM\_037847) is another VGAM847 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32716, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32493] Another function of VGAM847 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM\_037847). Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. LOC145501 (Accession XM\_085157) is another VGAM847 host target gene. LOC145501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145501 BINDING SITE, designated SEQ ID:37885, to the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, also designated SEQ ID:3558.

[32494] Another function of VGAM847 is therefore inhibition of LOC145501 (Accession XM\_085157). Accordingly, utilities

of VGAM847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145501. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 848 (VGAM848) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32495] VGAM848 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM848 was detected is described hereinabove with reference to Figs. 1–8.

[32496] VGAM848 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32497] VGAM848 gene encodes a VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM848 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM848 precursor RNA is designated SEQ ID:834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:834 is located at position 132736 relative to the genome of Gallid Herpesvirus 2.

[32498] VGAM848 precursor RNA folds onto itself, forming VGAM848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32499] An enzyme complex designated DICER COMPLEX, `dices` the VGAM848 folded precursor RNA into VGAM848 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM848 RNA is designated SEQ ID:3559, and

is provided hereinbelow with reference to the sequence listing part.

[32500] VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM848 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32501] VGAM848 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM848 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM848 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32502] The complementary binding of VGAM848 RNA, herein designated VGAM RNA, to host target binding sites on VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM848 host target RNA into VGAM848 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32503] It is appreciated that VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM848 host target genes. The mRNA of each one of this plurality of VGAM848 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM848 RNA, herein designated VGAM RNA, and which when bound by VGAM848 RNA causes inhibition of translation of respective one or more VGAM848 host target proteins.

[32504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM848 gene, herein designated VGAM GENE, on one or more VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32505] It is yet further appreciated that a function of VGAM848 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM848 correlate with, and may be deduced from, the identity of the host target genes which VGAM848 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32506] Nucleotide sequences of the VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM848 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM848 are further described hereinbelow with reference to Table 1.

[32507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM848 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM848 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32508] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM848 gene, herein designated VGAM is inhibition of expression of VGAM848 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM848 correlate with, and may be deduced from, the identity of the target genes which VGAM848 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32509] Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM\_001712) is a VGAM848 host target gene. CEACAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:7439, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32510] A function of VGAM848 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM\_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accord-

ingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM93. Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978) is another VGAM848 host target gene. EPB49 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB49 BINDING SITE, designated SEQ ID:7707, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32511] Another function of VGAM848 is therefore inhibition of Erythrocyte Membrane Protein Band 4.9 (dematin) (EPB49, Accession NM\_001978), a gene which is an actin-bundling protein. Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB49. The function of EPB49 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM760. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408) is another VGAM848 host target gene. MGAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8230, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32512] Another function of VGAM848 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396) is another VGAM848 host target gene. PHLDA3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PHLDA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHLDA3 BINDING SITE, designated SEQ ID:14758, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32513] Another function of VGAM848 is therefore inhibition of Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHLDA3. DRCTNNB1A (Accession NM\_032581) is another VGAM848 host target gene. DRCTNNB1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DRCTNNB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRCTNNB1A BINDING SITE, designated SEQ ID:26315, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32514] Another function of VGAM848 is therefore inhibition of DRCTNNB1A (Accession NM\_032581). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRCTNNB1A. KIAA0876 (Accession XM\_035625) is another VGAM848 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32292, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32515] Another function of VGAM848 is therefore inhibition of KIAA0876 (Accession XM\_035625). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201) is another VGAM848 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ ID:42786, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32516] Another function of VGAM848 is therefore inhibition of l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM\_015878) is another VGAM848 host target gene. OAZIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZIN BINDING SITE, designated SEQ ID:18019, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32517] Another function of VGAM848 is therefore inhibition of

Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM\_015878). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZIN. LOC146336 (Accession XM\_085421) is another VGAM848 host target gene. LOC146336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146336 BINDING SITE, designated SEQ ID:38132, to the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, also designated SEQ ID:3559.

[32518] Another function of VGAM848 is therefore inhibition of LOC146336 (Accession XM\_085421). Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 849 (VGAM849) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[32519] VGAM849 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM849 was detected is described hereinabove with reference to Figs. 1–8.

[32520] VGAM849 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32521] VGAM849 gene encodes a VGAM849 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM849 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM849 precursor RNA is designated SEQ ID:835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:835 is located at position 12797 relative to the genome of Lymphocystis Disease Virus 1.

[32522] VGAM849 precursor RNA folds onto itself, forming VGAM849 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[32523] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM849 folded precursor RNA into VGAM849 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM849 RNA is designated SEQ ID:3560, and  
is provided hereinbelow with reference to the sequence  
listing part.

[32524] VGAM849 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM849 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM849 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32525] VGAM849 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM849 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM849 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32526] The complementary binding of VGAM849 RNA, herein designated VGAM RNA, to host target binding sites on VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM849 host target RNA into VGAM849 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32527] It is appreciated that VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM849 host target genes. The mRNA of each one of this plurality of VGAM849 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM849 RNA, herein designated VGAM RNA, and which when bound by VGAM849 RNA causes inhibition of translation of respective one or more VGAM849 host target proteins.

[32528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM849 gene, herein designated VGAM GENE, on one or more VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32529] It is yet further appreciated that a function of VGAM849 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM849 correlate with, and may be deduced from, the identity of the host target genes which VGAM849 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[32530] Nucleotide sequences of the VGAM849 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM849 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM849 are further described hereinbelow with reference to Table 1.

[32531] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM849 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM849 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32532] As mentioned hereinabove with reference to Fig. 1, a function of VGAM849 gene, herein designated VGAM is inhibition of expression of VGAM849 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM849 correlate with, and may be deduced from, the identity of the target genes which VGAM849 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32533] Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463) is a VGAM849 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11946, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32534] A function of VGAM849 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Isocitrate Dehydrogenase 3 (NAD+) Alpha (IDH3A, Accession NM\_005530) is another VGAM849 host target gene. IDH3A BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by IDH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH3A BINDING SITE, designated SEQ ID:12050, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32535] Another function of VGAM849 is therefore inhibition of Isocitrate Dehydrogenase 3 (NAD<sup>+</sup>) Alpha (IDH3A, Accession NM\_005530), a gene which decarboxylates isocitrate into alpha-ketoglutarate in the TCA cycle. Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH3A. The function of IDH3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM349. Insulin Receptor Substrate 1 (IRS1, Accession NM\_005544) is another VGAM849 host target gene. IRS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of IRS1 BINDING SITE, designated SEQ ID:12067, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32536] Another function of VGAM849 is therefore inhibition of Insulin Receptor Substrate 1 (IRS1, Accession NM\_005544), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS1. The function of IRS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281.PAG (Accession NM\_018440) is another VGAM849 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:20507, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3560.

[32537] Another function of VGAM849 is therefore inhibition of PAG (Accession NM\_018440). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Tumor Protein P63 (TP63, Accession NM\_003722) is another VGAM849 host target gene. TP63 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP63 BINDING SITE, designated SEQ ID:9813, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32538] Another function of VGAM849 is therefore inhibition of Tumor Protein P63 (TP63, Accession NM\_003722). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP63. Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168) is another VGAM849 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:11665, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32539] Another function of VGAM849 is therefore inhibition of Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. Chemokine (C-C motif) Receptor 8 (CCR8, Accession NM\_005201) is another VGAM849 host target gene. CCR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR8 BINDING SITE, designated SEQ ID:11700, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32540] Another function of VGAM849 is therefore inhibition of

Chemokine (C-C motif) Receptor 8 (CCR8, Accession NM\_005201). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR8. FLJ10110 (Accession NM\_017998) is another VGAM849 host target gene. FLJ10110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10110 BINDING SITE, designated SEQ ID:19726, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32541] Another function of VGAM849 is therefore inhibition of FLJ10110 (Accession NM\_017998). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10110. FLJ10895 (Accession NM\_019084) is another VGAM849 host target gene. FLJ10895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10895 BINDING SITE, designated SEQ ID:21156, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32542] Another function of VGAM849 is therefore inhibition of FLJ10895 (Accession NM\_019084). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10895. KIAA0419 (Accession NM\_014711) is another VGAM849 host target gene. KIAA0419 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0419 BINDING SITE, designated SEQ ID:16257, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32543] Another function of VGAM849 is therefore inhibition of KIAA0419 (Accession NM\_014711). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0419. KIAA0445 (Accession NM\_014675) is another VGAM849 host target gene. KIAA0445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0445 BINDING SITE, designated SEQ ID:16144, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32544] Another function of VGAM849 is therefore inhibition of KIAA0445 (Accession NM\_014675). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0445. KIAA1627 (Accession XM\_087571) is another VGAM849 host target gene. KIAA1627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1627 BINDING SITE, designated SEQ ID:39343, to the nucleotide sequence of VGAM849 RNA, herein designated

VGAM RNA, also designated SEQ ID:3560.

[32545] Another function of VGAM849 is therefore inhibition of KIAA1627 (Accession XM\_087571). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1627. Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_031988) is another VGAM849 host target gene. MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2, designated SEQ ID:25699 and SEQ ID:8639 respectively, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32546] Another function of VGAM849 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_031988). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K6. LOC128338 (Accession XM\_059238) is another VGAM849

host target gene. LOC128338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC128338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128338 BINDING SITE, designated SEQ ID:36924, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32547] Another function of VGAM849 is therefore inhibition of LOC128338 (Accession XM\_059238). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128338. LOC130507 (Accession XM\_059440) is another VGAM849 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:36994, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32548] Another function of VGAM849 is therefore inhibition of LOC130507 (Accession XM\_059440). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC137090 (Accession XM\_070226) is another VGAM849 host target gene. LOC137090 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC137090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137090 BINDING SITE, designated SEQ ID:37392, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32549] Another function of VGAM849 is therefore inhibition of LOC137090 (Accession XM\_070226). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137090. LOC144262 (Accession XM\_084793) is another VGAM849 host target gene. LOC144262 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144262, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144262 BINDING SITE, designated SEQ ID:37702, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32550] Another function of VGAM849 is therefore inhibition of LOC144262 (Accession XM\_084793). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144262. LOC145482 (Accession XM\_085154) is another VGAM849 host target gene. LOC145482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145482 BINDING SITE, designated SEQ ID:37876, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32551] Another function of VGAM849 is therefore inhibition of LOC145482 (Accession XM\_085154). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145482. LOC149579 (Accession XM\_048743) is another VGAM849 host target gene. LOC149579 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149579 BINDING SITE, designated SEQ ID:35240, to the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, also designated SEQ ID:3560.

[32552] Another function of VGAM849 is therefore inhibition of LOC149579 (Accession XM\_048743). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149579. LOC154792 (Accession XM\_098608) is another VGAM849 host target gene. LOC154792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154792 BINDING SITE, designated SEQ ID:41727, to the nucleotide sequence of VGAM849 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3560.

[32553] Another function of VGAM849 is therefore inhibition of LOC154792 (Accession XM\_098608). Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154792. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 850 (VGAM850) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32554] VGAM850 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM850 was detected is described hereinabove with reference to Figs. 1–8.

[32555] VGAM850 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32556] VGAM850 gene encodes a VGAM850 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM850 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM850 precursor RNA is designated SEQ ID:836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:836 is located at position 13536 relative to the genome of Lymphocystis Disease Virus 1.

[32557] VGAM850 precursor RNA folds onto itself, forming VGAM850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32558] An enzyme complex designated DICER COMPLEX, `dices` the VGAM850 folded precursor RNA into VGAM850 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM850 RNA is designated SEQ ID:3561, and is provided hereinbelow with reference to the sequence listing part.

[32559] VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM850 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[32560] VGAM850 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM850 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM850 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32561] The complementary binding of VGAM850 RNA, herein designated VGAM RNA, to host target binding sites on VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM850 host target RNA into VGAM850 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32562] It is appreciated that VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM850 host target genes. The mRNA of

each one of this plurality of VGAM850 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM850 RNA, herein designated VGAM RNA, and which when bound by VGAM850 RNA causes inhibition of translation of respective one or more VGAM850 host target proteins.

[32563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM850 gene, herein designated VGAM GENE, on one or more VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32564] It is yet further appreciated that a function of VGAM850 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM850 correlate with, and may be deduced from, the identity of the host target genes which VGAM850 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32565] Nucleotide sequences of the VGAM850 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM850 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM850 are further described hereinbelow with reference to Table 1.

[32566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM850 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM850 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32567] As mentioned hereinabove with reference to Fig. 1, a function of VGAM850 gene, herein designated VGAM is inhibition of expression of VGAM850 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM850 correlate with, and may be deduced from, the identity of the target genes which VGAM850 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32568] Actinin, Alpha 2 (ACTN2, Accession NM\_001103) is a VGAM850 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6758, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32569] A function of VGAM850 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM\_001103), a gene which an actin-binding protein with multiple roles in different cell

types. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM88.UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM\_001497) is another VGAM850 host target gene. B4GALT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT1 BINDING SITE, designated SEQ ID:7247, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32570] Another function of VGAM850 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM\_001497). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT1. Bromodomain and PHD Finger Con-

taining, 1 (BRPF1, Accession XM\_054520) is another VGAM850 host target gene. BRPF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRPF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRPF1 BINDING SITE, designated SEQ ID:36174, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32571] Another function of VGAM850 is therefore inhibition of Bromodomain and PHD Finger Containing, 1 (BRPF1, Accession XM\_054520), a gene which has 6 zinc finger motifs and a bromodomain. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRPF1. The function of BRPF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483) is another VGAM850 host target gene. CEACAM6 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by CEACAM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM6 BINDING SITE, designated SEQ ID:8310, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32572] Another function of VGAM850 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483), a gene which Non-specific cross reacting antigen (. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM6. The function of CEACAM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM286. Cartilage Associated Protein (CRTAP, Accession NM\_006371) is another VGAM850 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13062, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32573] Another function of VGAM850 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM\_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Dipeptidylpeptidase IV (CD26, adenosine deaminase complexing protein 2) (DPP4, Accession NM\_001935) is another VGAM850 host target gene. DPP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

DPP4 BINDING SITE, designated SEQ ID:7648, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32574] Another function of VGAM850 is therefore inhibition of Dipeptidylpeptidase IV (CD26, adenosine deaminase complexing protein 2) (DPP4, Accession NM\_001935), a gene which removes n-terminal dipeptides sequentially from polypeptides. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPP4. The function of DPP4 has been established by previous studies. Koch and Shows (1979, 1980) concluded that at least 3 genes are involved in the expression of adenosine deaminase complexing protein: ADA (OMIM Ref. No. 102700) on chromosome 20, ADCP1 (OMIM Ref. No. 102710) on chromosome 6, and ADCP2 on chromosome 2. On the other hand, from studies in mouse-man and hamster-man hybrid cells, Herschleb-Voogt et al. (1981) concluded that a gene or genes on human chromosome 2 determine the expression of ADCP and that neither chromosome 6 nor any other of the chromosomes of man carries genes involved in the formation of ADCP. Van Cong et al. (1981) concluded that the gene for ADCP on chromosome 2 is located between

MDH1 (OMIM Ref. No. 154200) and IDH1 (OMIM Ref. No. 147700), i.e., in the segment 2p23–q32. Could one form of adenosine deaminase deficiency (leading to severe combined immunodeficiency) represent, in fact, deficiency of the complexing protein? Dipeptidyl peptidase IV (DPP4; EC 3.4.14.5) is identical to ADA complexing protein–2 and to the T–cell activation antigen CD26. DPP4 is a serine exopeptidase that cleaves X–proline dipeptides from the N terminus of polypeptides. It is an intrinsic membrane glycoprotein anchored into the cell membrane by its N–terminal end. High levels of the enzyme are found in the brush–border membranes of the kidney proximal tubule and of the small intestine, but several other tissues also express the enzyme. The enzyme is present in the fetal colon but disappears at birth. It is ectopically expressed in some human colon adenocarcinomas and human colon cancer cell lines. From such a colon cancer cell line, Darmoul et al. (1990) isolated a cDNA probe for intestinal dipeptidyl peptidase IV and, by Southern analysis of somatic cell hybrids, assigned the gene to chromosome 2. This assignment was confirmed by Mathew et al. (1994), who sublocalized the DPP4 gene to 2q23 by fluorescence in situ hybridization. Misumi et al. (1992) isolated and se–

quenced the cDNA coding for DPP4. The nucleotide sequence (3,465 bp) of the cDNA contained an open reading frame encoding a polypeptide comprising 766 amino acids, 1 residue less than those of the rat protein. The predicted amino acid sequence exhibited 84.9% identity to that of the rat enzyme.

[32575] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32576] Mathew, S.; Morrison, M. E.; Murty, V. V. V. S.; Houghton, A. N.; Chaganti, R. S. K. : Assignment of the DPP4 gene encoding adenosine deaminase binding protein (CD26/dipeptidylpeptidase IV) to 2q23. *Genomics* 22: 211–212, 1994. ; and

[32577] Van Cong, N.; Weil, D.; Gross, M.–S.; Foubert, C.; Jami, J.; Frezal, J. : Controle genetique et epigenetique de l'expression de l'adenosine deaminase. *Analyse des cellules humaines et h.*

[32578] Further studies establishing the function and utilities of DPP4 are found in John Hopkins OMIM database record ID 102720, and in cited publications numbered 2347–235 and 12114–2357 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.Follistatin-like 1 (FSTL1, Accession NM\_007085) is another VGAM850 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13952, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32579] Another function of VGAM850 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM\_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM\_042167) is another VGAM850 host target gene. FUT9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by FUT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT9 BINDING SITE, designated SEQ ID:33701, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32580] Another function of VGAM850 is therefore inhibition of Fucosyltransferase 9 (alpha (1,3) Fucosyltransferase) (FUT9, Accession XM\_042167), a gene which catalyzes alpha-1,3 glycosidic linkages. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT9. The function of FUT9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. GM2 Ganglioside Activator Protein (GM2A, Accession XM\_041978) is another VGAM850 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GM2A BINDING SITE, designated SEQ ID:33660, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32581] Another function of VGAM850 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM\_041978). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. Nucleoporin 62kDa (NUP62, Accession NM\_016553) is another VGAM850 host target gene. NUP62 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP62, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP62 BINDING SITE, designated SEQ ID:18629, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32582] Another function of VGAM850 is therefore inhibition of Nucleoporin 62kDa (NUP62, Accession NM\_016553). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with NUP62. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM850 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8522, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32583] Another function of VGAM850 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Plexin A2 (PLXNA2, Accession NM\_025179) is another VGAM850 host target gene. PLXNA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

PLXNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:24815, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32584] Another function of VGAM850 is therefore inhibition of Plexin A2 (PLXNA2, Accession NM\_025179), a gene which is a transmembrane protein. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA2. The function of PLXNA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM\_006244) is another VGAM850 host target gene. PPP2R5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PPP2R5B BINDING SITE, designated SEQ ID:12914, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32585] Another function of VGAM850 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM\_006244), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5B. The function of PPP2R5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Transformation/transcription Domain-associated Protein (TRRAP, Accession NM\_003496) is another VGAM850 host target gene. TRRAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRRAP BINDING SITE, designated SEQ ID:9590, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3561.

[32586] Another function of VGAM850 is therefore inhibition of Transformation/transcription Domain-associated Protein (TRRAP, Accession NM\_003496). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRRAP. Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM\_000638) is another VGAM850 host target gene. VTN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VTN BINDING SITE, designated SEQ ID:6273, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32587] Another function of VGAM850 is therefore inhibition of Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM\_000638), a gene which is a cell adhesion and spreading factor found in serum and tissues. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with VTN. The function of VTN has been established by previous studies. Vitronectin, also called serum spreading factor or complement S-protein, is a 75-kD glycoprotein in plasma and tissue. (S-protein is not to be confused with protein S (OMIM Ref. No. 176880).) A multifunctional protein, it promotes attachment and spreading of animal cells in vitro, inhibits cytolysis by the complement C5b-9 complex, and modulates antithrombin III-thrombin action in blood coagulation. The primary structure of vitronectin has been deduced from the sequence of its cloned cDNA (Jenne and Stanley, 1985; Preissner et al., 1986). Polymorphism of vitronectin of plasma has been demonstrated (Conlon et al., 1988; Kubota et al., 1988). Sun and Mosher (1989) demonstrated that the frequencies are different in Orientals and Caucasians. By use of high resolution fluorescence in situ hybridization (FISH), Fink et al. (1992) mapped the VTN gene to 17q11. The localization was confirmed by cohybridization with a centromere-specific alphoid probe.

[32588] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [32589] Kubota, K.; Katayama, S.; Matsuda, M.; Hayashi, M. : Three types of vitronectin in human blood. Cell Struct. Funct. 13: 123–128, 1988. ; and
- [32590] Sun, W. H.; Mosher, D. F. : Polymorphism of vitronectin. (Letter) Blood 73: 353–354, 1989.
- [32591] Further studies establishing the function and utilities of VTN are found in John Hopkins OMIM database record ID 193190, and in cited publications numbered 14–19 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264) is another VGAM850 host target gene. C22orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ ID:14584, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.
- [32592] Another function of VGAM850 is therefore inhibition of Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264). Accordingly, utilities of VGAM850 in–

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5. Caspase Recruitment Domain Family, Member 14 (CARD14, Accession NM\_024110) is another VGAM850 host target gene.

CARD14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD14 BINDING SITE, designated SEQ ID:23557, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32593] Another function of VGAM850 is therefore inhibition of Caspase Recruitment Domain Family, Member 14 (CARD14, Accession NM\_024110). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD14. Carcinoembryonic Antigen-related Cell Adhesion Molecule 7 (CEACAM7, Accession NM\_006890) is another VGAM850 host target gene. CEACAM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEACAM7, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM7 BINDING SITE, designated SEQ ID:13757, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32594] Another function of VGAM850 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 7 (CEACAM7, Accession NM\_006890). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM7. Centaurin, Gamma 2 (CENTG2, Accession NM\_014914) is another VGAM850 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17159, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32595] Another function of VGAM850 is therefore inhibition of

Centaurin, Gamma 2 (CENTG2, Accession NM\_014914). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. CUG Triplet Repeat, RNA Binding Protein 2 (CUGBP2, Accession NM\_006561) is another VGAM850 host target gene. CUGBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUGBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUGBP2 BINDING SITE, designated SEQ ID:13331, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32596] Another function of VGAM850 is therefore inhibition of CUG Triplet Repeat, RNA Binding Protein 2 (CUGBP2, Accession NM\_006561). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUGBP2. CXYorf1 (Accession XM\_088704) is another VGAM850 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39909, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32597] Another function of VGAM850 is therefore inhibition of CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ10716 (Accession NM\_018191) is another VGAM850 host target gene. FLJ10716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10716 BINDING SITE, designated SEQ ID:20047, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32598] Another function of VGAM850 is therefore inhibition of FLJ10716 (Accession NM\_018191). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10716. FLJ10719 (Accession XM\_031328) is another VGAM850 host target gene. FLJ10719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10719 BINDING SITE, designated SEQ ID:31340, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32599] Another function of VGAM850 is therefore inhibition of FLJ10719 (Accession XM\_031328). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10719. FLJ20296 (Accession NM\_017750) is another VGAM850 host target gene. FLJ20296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20296 BINDING SITE, designated SEQ ID:19355, to the nucleotide sequence of

VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32600] Another function of VGAM850 is therefore inhibition of FLJ20296 (Accession NM\_017750). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20296. FLJ20772 (Accession NM\_017956) is another VGAM850 host target gene. FLJ20772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20772 BINDING SITE, designated SEQ ID:19666, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32601] Another function of VGAM850 is therefore inhibition of FLJ20772 (Accession NM\_017956). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20772. FLJ22215 (Accession XM\_173021) is another VGAM850 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:46282, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32602] Another function of VGAM850 is therefore inhibition of FLJ22215 (Accession XM\_173021). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. FLJ32752 (Accession NM\_144666) is another VGAM850 host target gene. FLJ32752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ32752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32752 BINDING SITE, designated SEQ ID:29482, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32603] Another function of VGAM850 is therefore inhibition of FLJ32752 (Accession NM\_144666). Accordingly, utilities of

VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32752. GRB2-associated Binding Protein 3 (GAB3, Accession NM\_080612) is another VGAM850 host target gene. GAB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:27928, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32604] Another function of VGAM850 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM\_080612). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. GR6 (Accession NM\_007354) is another VGAM850 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GR6 BINDING SITE, designated SEQ ID:14284, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32605] Another function of VGAM850 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. HSPC213 (Accession NM\_016475) is another VGAM850 host target gene. HSPC213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC213 BINDING SITE, designated SEQ ID:18576, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32606] Another function of VGAM850 is therefore inhibition of HSPC213 (Accession NM\_016475). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC213. Interleukin 17D (IL17D, Accession NM\_138284) is another VGAM850 host target gene. IL17D BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by IL17D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17D BINDING SITE, designated SEQ ID:28700, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32607] Another function of VGAM850 is therefore inhibition of Interleukin 17D (IL17D, Accession NM\_138284). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17D. KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559) is another VGAM850 host target gene. KHDRBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KHDRBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHDRBS1 BINDING SITE, designated SEQ ID:13328, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ

ID:3561.

[32608] Another function of VGAM850 is therefore inhibition of KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHDRBS1. KIAA0298 (Accession XM\_084529) is another VGAM850 host target gene. KIAA0298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:37627, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32609] Another function of VGAM850 is therefore inhibition of KIAA0298 (Accession XM\_084529). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0298. KIAA0461 (Accession XM\_047883) is another VGAM850 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35075, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32610] Another function of VGAM850 is therefore inhibition of KIAA0461 (Accession XM\_047883). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. KIAA0493 (Accession XM\_034717) is another VGAM850 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32142, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32611] Another function of VGAM850 is therefore inhibition of KIAA0493 (Accession XM\_034717). Accordingly, utilities

of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0766 (Accession NM\_014805) is another VGAM850 host target gene. KIAA0766 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated SEQ ID:16743, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32612] Another function of VGAM850 is therefore inhibition of KIAA0766 (Accession NM\_014805). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. KIAA0853 (Accession NM\_015070) is another VGAM850 host target gene. KIAA0853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0853 BINDING SITE, designated SEQ ID:17437, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32613] Another function of VGAM850 is therefore inhibition of KIAA0853 (Accession NM\_015070). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0853. KIAA0978 (Accession XM\_047013) is another VGAM850 host target gene. KIAA0978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0978 BINDING SITE, designated SEQ ID:34887, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32614] Another function of VGAM850 is therefore inhibition of KIAA0978 (Accession XM\_047013). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0978. KIAA1530 (Accession XM\_042661) is another VGAM850 host target gene. KIAA1530 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33735, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32615] Another function of VGAM850 is therefore inhibition of KIAA1530 (Accession XM\_042661). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. KIAA1559 (Accession XM\_054472) is another VGAM850 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36164, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32616] Another function of VGAM850 is therefore inhibition of

KIAA1559 (Accession XM\_054472). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. MGC2835 (Accession NM\_024072) is another VGAM850 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23506, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32617] Another function of VGAM850 is therefore inhibition of MGC2835 (Accession NM\_024072). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. MGC2865 (Accession NM\_032375) is another VGAM850 host target gene. MGC2865 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2865 BINDING SITE, designated SEQ ID:26168, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32618] Another function of VGAM850 is therefore inhibition of MGC2865 (Accession NM\_032375). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2865. MGC3130 (Accession NM\_024032) is another VGAM850 host target gene. MGC3130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3130 BINDING SITE, designated SEQ ID:23461, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32619] Another function of VGAM850 is therefore inhibition of MGC3130 (Accession NM\_024032). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3130. moblak (Accession NM\_130807) is another

VGAM850 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28309, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32620] Another function of VGAM850 is therefore inhibition of moblak (Accession NM\_130807). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. Myozenin 2 (MYOZ2, Accession NM\_016599) is another VGAM850 host target gene. MYOZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYOZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOZ2 BINDING SITE, designated SEQ ID:18692, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32621] Another function of VGAM850 is therefore inhibition of Myozenin 2 (MYOZ2, Accession NM\_016599). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOZ2. NDP52 (Accession NM\_005831) is another VGAM850 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12444, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32622] Another function of VGAM850 is therefore inhibition of NDP52 (Accession NM\_005831). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP52. Nei Like 2 (E. coli) (NEIL2, Accession NM\_145043) is another VGAM850 host target gene. NEIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEIL2 BINDING SITE, designated SEQ ID:29675, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32623] Another function of VGAM850 is therefore inhibition of Nei Like 2 (E. coli) (NEIL2, Accession NM\_145043). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEIL2. NRF (Accession NM\_017544) is another VGAM850 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18988, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32624] Another function of VGAM850 is therefore inhibition of NRF (Accession NM\_017544). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM850 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30144, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32625] Another function of VGAM850 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM\_007229) is another VGAM850 host target gene. PACSIN2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PACSIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN2 BINDING SITE, designated SEQ ID:14097, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32626] Another function of VGAM850 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM\_007229). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN2. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM\_002714) is another VGAM850 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8577, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ

ID:3561.

[32627] Another function of VGAM850 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM\_002714). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. RBT1 (Accession NM\_013368) is another VGAM850 host target gene. RBT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBT1 BINDING SITE, designated SEQ ID:15011, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32628] Another function of VGAM850 is therefore inhibition of RBT1 (Accession NM\_013368). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBT1. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564) is another VGAM850 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29359, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32629] Another function of VGAM850 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. SV2 (Accession NM\_014849) is another VGAM850 host target gene. SV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2 BINDING SITE, designated SEQ ID:16885, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32630] Another function of VGAM850 is therefore inhibition of SV2 (Accession NM\_014849). Accordingly, utilities of

VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2.

TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM850 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18075, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32631] Another function of VGAM850 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. TUBB5 (Accession NM\_006087) is another VGAM850 host target gene. TUBB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUBB5, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBB5 BINDING SITE, designated SEQ ID:12730, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32632] Another function of VGAM850 is therefore inhibition of TUBB5 (Accession NM\_006087). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB5. Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517) is another VGAM850 host target gene. UB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UB1 BINDING SITE, designated SEQ ID:15847, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32633] Another function of VGAM850 is therefore inhibition of Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517). Accordingly, utilities of VGAM850 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1. LOC125456 (Accession XM\_064620) is another VGAM850 host target gene. LOC125456 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC125456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125456 BINDING SITE, designated SEQ ID:37266, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32634] Another function of VGAM850 is therefore inhibition of LOC125456 (Accession XM\_064620). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125456. LOC125929 (Accession XM\_064872) is another VGAM850 host target gene. LOC125929 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC125929 BINDING SITE, designated SEQ ID:37269, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32635] Another function of VGAM850 is therefore inhibition of LOC125929 (Accession XM\_064872). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125929. LOC144438 (Accession XM\_084860) is another VGAM850 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37738, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32636] Another function of VGAM850 is therefore inhibition of LOC144438 (Accession XM\_084860). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438. LOC146733 (Accession XM\_097076) is another VGAM850 host target gene. LOC146733 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40730, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32637] Another function of VGAM850 is therefore inhibition of LOC146733 (Accession XM\_097076). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC149668 (Accession XM\_097692) is another VGAM850 host target gene. LOC149668 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149668 BINDING SITE, designated SEQ ID:41030, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32638] Another function of VGAM850 is therefore inhibition of

LOC149668 (Accession XM\_097692). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149668. LOC149911 (Accession XM\_097735) is another VGAM850 host target gene. LOC149911 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149911 BINDING SITE, designated SEQ ID:41083, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32639] Another function of VGAM850 is therefore inhibition of LOC149911 (Accession XM\_097735). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149911. LOC150271 (Accession XM\_097859) is another VGAM850 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41172, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32640] Another function of VGAM850 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC151647 (Accession XM\_087261) is another VGAM850 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39155, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32641] Another function of VGAM850 is therefore inhibition of LOC151647 (Accession XM\_087261). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC152220 (Accession XM\_098176) is an-

other VGAM850 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41444, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32642] Another function of VGAM850 is therefore inhibition of LOC152220 (Accession XM\_098176). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC155054 (Accession XM\_088140) is another VGAM850 host target gene. LOC155054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155054 BINDING SITE, designated SEQ ID:39540, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32643] Another function of VGAM850 is therefore inhibition of LOC155054 (Accession XM\_088140). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155054. LOC158055 (Accession XM\_088453) is another VGAM850 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39706, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32644] Another function of VGAM850 is therefore inhibition of LOC158055 (Accession XM\_088453). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. LOC200093 (Accession XM\_032184) is another VGAM850 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31601, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32645] Another function of VGAM850 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC200310 (Accession XM\_037840) is another VGAM850 host target gene. LOC200310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200310 BINDING SITE, designated SEQ ID:32709, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32646] Another function of VGAM850 is therefore inhibition of LOC200310 (Accession XM\_037840). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200310. LOC202024 (Accession XM\_114422) is another VGAM850 host target gene. LOC202024 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202024 BINDING SITE, designated SEQ ID:42959, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32647] Another function of VGAM850 is therefore inhibition of LOC202024 (Accession XM\_114422). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202024. LOC202347 (Accession XM\_117390) is another VGAM850 host target gene. LOC202347 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202347 BINDING SITE, designated SEQ ID:43431, to the nucleotide sequence of VGAM850 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3561.

[32648] Another function of VGAM850 is therefore inhibition of LOC202347 (Accession XM\_117390). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202347. LOC202934 (Accession XM\_117486) is another VGAM850 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43461, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32649] Another function of VGAM850 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC220514 (Accession XM\_017498) is another VGAM850 host target gene. LOC220514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220514, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220514 BINDING SITE, designated SEQ ID:30321, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32650] Another function of VGAM850 is therefore inhibition of LOC220514 (Accession XM\_017498). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220514. LOC220776 (Accession XM\_043388) is another VGAM850 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33935, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32651] Another function of VGAM850 is therefore inhibition of LOC220776 (Accession XM\_043388). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC220776. LOC221931 (Accession XM\_168348) is another VGAM850 host target gene. LOC221931 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221931 BINDING SITE, designated SEQ ID:45119, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32652] Another function of VGAM850 is therefore inhibition of LOC221931 (Accession XM\_168348). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221931. LOC253675 (Accession XM\_172990) is another VGAM850 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46265, to

the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32653] Another function of VGAM850 is therefore inhibition of LOC253675 (Accession XM\_172990). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC253782 (Accession XM\_171023) is another VGAM850 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45798, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32654] Another function of VGAM850 is therefore inhibition of LOC253782 (Accession XM\_171023). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253782. LOC254428 (Accession XM\_170932) is another VGAM850 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45718, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32655] Another function of VGAM850 is therefore inhibition of LOC254428 (Accession XM\_170932). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC254848 (Accession XM\_173133) is another VGAM850 host target gene. LOC254848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254848 BINDING SITE, designated SEQ ID:46381, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32656] Another function of VGAM850 is therefore inhibition of LOC254848 (Accession XM\_173133). Accordingly, utilities

of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254848. LOC56267 (Accession NM\_019610) is another VGAM850 host target gene. LOC56267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56267 BINDING SITE, designated SEQ ID:21228, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32657] Another function of VGAM850 is therefore inhibition of LOC56267 (Accession NM\_019610). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56267. LOC57105 (Accession NM\_020377) is another VGAM850 host target gene. LOC57105 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC57105 BINDING SITE, designated SEQ ID:21641, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32658] Another function of VGAM850 is therefore inhibition of LOC57105 (Accession NM\_020377). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57105. LOC83693 (Accession NM\_031463) is another VGAM850 host target gene. LOC83693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83693 BINDING SITE, designated SEQ ID:25496, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32659] Another function of VGAM850 is therefore inhibition of LOC83693 (Accession NM\_031463). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83693. LOC90670 (Accession XM\_033352) is another VGAM850 host target gene. LOC90670 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90670 BINDING SITE, designated SEQ ID:31882, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32660] Another function of VGAM850 is therefore inhibition of LOC90670 (Accession XM\_033352). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90670. LOC91040 (Accession XM\_035641) is another VGAM850 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32318, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32661] Another function of VGAM850 is therefore inhibition of

LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC96597 (Accession XM\_039922) is another VGAM850 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33232, to the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, also designated SEQ ID:3561.

[32662] Another function of VGAM850 is therefore inhibition of LOC96597 (Accession XM\_039922). Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 851 (VGAM851) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[32663] VGAM851 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM851 was detected is described hereinabove with reference to Figs. 1–8.

[32664] VGAM851 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32665] VGAM851 gene encodes a VGAM851 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM851 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM851 precursor RNA is designated SEQ ID:837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:837 is located at position 13906 relative to the genome of Lymphocystis Disease Virus 1.

[32666] VGAM851 precursor RNA folds onto itself, forming VGAM851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[32667] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM851 folded precursor RNA into VGAM851 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 41%) nucleotide se-  
quence of VGAM851 RNA is designated SEQ ID:3562, and  
is provided hereinbelow with reference to the sequence  
listing part.

[32668] VGAM851 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM851 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM851 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32669] VGAM851 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM851 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM851 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[32670] The complementary binding of VGAM851 RNA, herein designated VGAM RNA, to host target binding sites on VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM851 host target RNA into VGAM851 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32671] It is appreciated that VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM851 host target genes. The mRNA of each one of this plurality of VGAM851 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM851 RNA, herein designated VGAM RNA, and which when bound by VGAM851 RNA causes inhibition of translation of respective one or more VGAM851 host target proteins.

[32672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM851 gene, herein designated VGAM GENE, on one or

more VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32673] It is yet further appreciated that a function of VGAM851 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM851 correlate with, and may be deduced from, the identity of the host target genes which VGAM851 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [32674] Nucleotide sequences of the VGAM851 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM851 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM851 are further described hereinbelow with reference to Table 1.
- [32675] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM851 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM851 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [32676] As mentioned hereinabove with reference to Fig. 1, a function of VGAM851 gene, herein designated VGAM is inhibition of expression of VGAM851 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM851 correlate with, and may be deduced from, the identity of the target genes which VGAM851 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [32677] Chloride Channel, Calcium Activated, Family Member 2

(CLCA2, Accession NM\_006536) is a VGAM851 host target gene. CLCA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCA2 BINDING SITE, designated SEQ ID:13290, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32678] A function of VGAM851 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 2 (CLCA2, Accession NM\_006536), a gene which Calcium-sensitive chloride channel, is suggested to play a role in the complex pathogenesis of cystic fibrosis. Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCA2. The function of CLCA2 has been established by previous studies. Members of the CLCA family of calcium-activated chloride channels, such as human CLCA1 (OMIM Ref. No. 603906) and bovine lung-endothelial cell adhesion molecule-1 (Lu-ECAM-1), appear to have a conserved structure and function but significantly different tissue

expression patterns. By screening a human lung cDNA library with a Lu-ECAM-1 cDNA, Gruber et al. (1999) isolated cDNAs encoding CLCA2. The 943-amino acid protein deduced from the CLCA2 cDNAs is 76% and 51% identical to Lu-ECAM-1 and human CLCA1, respectively. Glycosylation site scanning and protease protection assays predicted that CLCA2 has 5 transmembrane domains and a large N-terminal extracellular domain. CLCA2 also contains a signal sequence, conserved cysteine residues within its N-terminal extracellular domain, a conserved consensus site for monobasic proteolytic cleavage, several potential glycosylation sites, and a number of potential phosphorylation sites for protein kinase C (see OMIM Ref. No. 176982). Northern blot analysis detected a 3.6-kb CLCA2 transcript in trachea and mammary gland; in addition to these tissues, RT-PCR showed expression in lung. Recombinant CLCA2 was expressed in mammalian cells as a 120-kD primary translation product that was cleaved into an 86-kD N-terminal polypeptide and a 34-kD C-terminal polypeptide, both of which were associated with the outer cell surface. Expression of recombinant CLCA2 in HEK 293 cells resulted in a slightly outwardly rectifying anion conductance that was increased in the presence of

the calcium ionophore ionomycin and inhibited by DIDS, dithiothreitol, niflumic acid, and tamoxifen. By radiation hybrid analysis, Gruber and Pauli (1999) determined that the CLCA2 and CLCA3 genes map to 1p31–p22, where the CLCA1 gene had been assigned. Thus, all human CLCA family members known to that time were shown to be clustered on the short arm of chromosome 1 despite their moderately low levels of sequence homology and their heterogeneous expression patterns.

[32679] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32680] Gruber, A. D.; Pauli, B. U. : Clustering of the human CLCA gene family on the short arm of chromosome 1 (1p22–31). *Genome* 42: 1030–1032, 1999. ; and

[32681] Gruber, A. D.; Schreur, K. D.; Ji, H.–L.; Fuller, C. M.; Pauli, B. U. : Molecular cloning and transmembrane structure of hCLCA2 from human lung, trachea, and mammary gland. *Am. J. Phys.*

[32682] Further studies establishing the function and utilities of CLCA2 are found in John Hopkins OMIM database record ID 604003, and in cited publications numbered 739 and 8199 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM\_004339) is another VGAM851 host target gene. PTTG1IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTTG1IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTTG1IP BINDING SITE, designated SEQ ID:10540, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32683] Another function of VGAM851 is therefore inhibition of Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM\_004339), a gene which facilitates the translocation of PTTG to the nucleus. Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTTG1IP. The function of PTTG1IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083) is an-

other VGAM851 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22063, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32684] Another function of VGAM851 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM\_021083). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. DKFZp564K142 (Accession NM\_032121) is another VGAM851 host target gene. DKFZp564K142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp564K142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:25807, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM

RNA, also designated SEQ ID:3562.

[32685] Another function of VGAM851 is therefore inhibition of DKFZp564K142 (Accession NM\_032121). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142. FLJ13197 (Accession NM\_024614) is another VGAM851 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23876, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32686] Another function of VGAM851 is therefore inhibition of FLJ13197 (Accession NM\_024614). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. KIAA0186 (Accession NM\_021067) is another VGAM851 host target gene. KIAA0186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0186, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:22040, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32687] Another function of VGAM851 is therefore inhibition of KIAA0186 (Accession NM\_021067). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186. MGC4562 (Accession NM\_133375) is another VGAM851 host target gene. MGC4562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4562 BINDING SITE, designated SEQ ID:28497, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32688] Another function of VGAM851 is therefore inhibition of MGC4562 (Accession NM\_133375). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC4562. LOC151258 (Accession XM\_087146) is another VGAM851 host target gene. LOC151258 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151258 BINDING SITE, designated SEQ ID:39091, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32689] Another function of VGAM851 is therefore inhibition of LOC151258 (Accession XM\_087146). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151258. LOC157798 (Accession XM\_098827) is another VGAM851 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41845, to

the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32690] Another function of VGAM851 is therefore inhibition of LOC157798 (Accession XM\_098827). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC200803 (Accession XM\_114299) is another VGAM851 host target gene. LOC200803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200803 BINDING SITE, designated SEQ ID:42855, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32691] Another function of VGAM851 is therefore inhibition of LOC200803 (Accession XM\_114299). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200803. LOC256642 (Accession XM\_172797) is another VGAM851 host target gene. LOC256642 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC256642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256642 BINDING SITE, designated SEQ ID:46080, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32692] Another function of VGAM851 is therefore inhibition of LOC256642 (Accession XM\_172797). Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256642. LOC89932 (Accession XM\_027341) is another VGAM851 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30493, to the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, also designated SEQ ID:3562.

[32693] Another function of VGAM851 is therefore inhibition of LOC89932 (Accession XM\_027341). Accordingly, utilities

of VGAM851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 852 (VGAM852) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32694] VGAM852 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM852 was detected is described hereinabove with reference to Figs. 1–8.

[32695] VGAM852 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32696] VGAM852 gene encodes a VGAM852 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM852 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM852 precursor RNA is designated SEQ ID:838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:838 is located at position 135041 relative to the genome of Moluscum Contagiosum Virus.

[32697] VGAM852 precursor RNA folds onto itself, forming VGAM852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32698] An enzyme complex designated DICER COMPLEX, `dices` the VGAM852 folded precursor RNA into VGAM852 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM852 RNA is designated SEQ ID:3563, and

is provided hereinbelow with reference to the sequence listing part.

[32699] VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM852 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32700] VGAM852 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM852 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM852 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32701] The complementary binding of VGAM852 RNA, herein designated VGAM RNA, to host target binding sites on VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM852 host target RNA into VGAM852 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32702] It is appreciated that VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM852 host target genes. The mRNA of each one of this plurality of VGAM852 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM852 RNA, herein designated VGAM RNA, and which when bound by VGAM852 RNA causes inhibition of translation of respective one or more VGAM852 host target proteins.

[32703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM852 gene, herein designated VGAM GENE, on one or more VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32704] It is yet further appreciated that a function of VGAM852 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM852 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM852 correlate with, and may be deduced from, the identity of the host target genes which VGAM852 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32705] Nucleotide sequences of the VGAM852 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM852 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM852 are further described hereinbelow with reference to Table 1.

[32706] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM852 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM852 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32707] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM852 gene, herein designated VGAM is inhibition of expression of VGAM852 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM852 correlate with, and may be deduced from, the identity of the target genes which VGAM852 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32708] Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636) is a VGAM852 host target gene. KCNAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:9705, to the nucleotide sequence of VGAM852 RNA, herein designated VGAM RNA, also designated SEQ ID:3563.

[32709] A function of VGAM852 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636), a gene which is the beta subunit of shaker voltage-gated potassium channels. Accordingly, utilities of VGAM852 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2. The function of KCNAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659. Lactotransferrin (LTF, Accession NM\_002343) is another VGAM852 host target gene. LTF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LTF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTF BINDING SITE, designated SEQ ID:8142, to the nucleotide sequence of VGAM852 RNA, herein designated VGAM RNA, also designated SEQ ID:3563.

[32710] Another function of VGAM852 is therefore inhibition of Lactotransferrin (LTF, Accession NM\_002343), a gene which is an iron binding transport protein. Accordingly, utilities of VGAM852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTF. The function of LTF has been established by previous studies. *Haemophilus influenzae* is a major cause of otitis media and other respiratory tract disease in chil-

dren. The pathogenesis of the disease begins with colonization of the upper respiratory mucosa, a process that involves evasion of local immune mechanisms and adherence to epithelial cells. Several studies demonstrated that human milk is protective against *H. influenzae* colonization and disease. Qiu et al. (1998) examined the effect of human milk on 2 autotransported proteins of *H. influenzae* that are presumed to facilitate colonization: IgA1 protease and Hap adhesin. They found that human milk lactoferrin efficiently extracted the IgA1 protease preprotein from the bacterial outer membrane. In addition, lactoferrin specifically degraded the Hap adhesin and abolished Hap-mediated adherence. The results suggested that human milk lactoferrin attenuates the pathogenic potential of *H. influenzae* by selectively inactivating IgA1 protease and Hap, thereby interfering with colonization. They suggested that future studies should examine the therapeutic potential of lactoferrin, perhaps as a supplement in infant formulas. Human T-cell leukemia virus-1 (OMIM Ref. No. HTLV-1) causes T-cell leukemia and lymphoma and is clustered in certain geographic areas. Like HIV-1 infection, HTLV-1 infection can be transmitted vertically through breast milk. Refraining

from breast feeding was found to efficiently block mother-to-infant transmission in southwestern Japan. Moriuchi and Moriuchi (2001) observed a dose-dependent enhancement of HTLV-1 replication by transactivating the viral long terminal repeat in cells stimulated with human or bovine lactoferrin. Lactoferrin also accelerated transmission to uninfected cord blood mononuclear cells. Moriuchi and Moriuchi (2001) confirmed that lactoferrin inhibits HIV-1 replication and showed that it does so by nonspecifically blocking viral fusion to cells

[32711] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32712] Qiu, J.; Hendrixson, D. R.; Baker, E. N.; Murphy, T. F.; St. Geme, J. W., III; Plaut, A. G. : Human milk lactoferrin inactivates two putative colonization factors expressed by *Haemophilus influenzae*. *Proc. Nat. Acad. Sci.* 95: 12641-12646, 1998. ; and

[32713] Moriuchi, M.; Moriuchi, H. : A milk protein lactoferrin enhances human T cell leukemia virus type I and suppresses HIV-1 infection. *J. Immun.* 166: 4231-4236, 2001.

[32714] Further studies establishing the function and utilities of LTF are found in John Hopkins OMIM database record ID

150210, and in cited publications numbered 11339–11348 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ20294 (Accession NM\_017749) is another VGAM852 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19344, to the nucleotide sequence of VGAM852 RNA, herein designated VGAM RNA, also designated SEQ ID:3563.

[32715] Another function of VGAM852 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 853 (VGAM853) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32716] VGAM853 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM853 was detected is described hereinabove with reference to Figs. 1–8.

[32717] VGAM853 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32718] VGAM853 gene encodes a VGAM853 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM853 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM853 precursor RNA is designated SEQ ID:839, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:839 is located at position 202536 relative to the genome of Ectromelia Virus.

[32719] VGAM853 precursor RNA folds onto itself, forming VGAM853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32720] An enzyme complex designated DICER COMPLEX, `dices` the VGAM853 folded precursor RNA into VGAM853 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM853 RNA is designated SEQ ID:3564, and is provided hereinbelow with reference to the sequence listing part.

[32721] VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM853 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[32722] VGAM853 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM853 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM853 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32723] The complementary binding of VGAM853 RNA, herein designated VGAM RNA, to host target binding sites on VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM853 host target RNA into VGAM853 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32724] It is appreciated that VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM853 host target genes. The mRNA of each one of this plurality of VGAM853 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM853 RNA, herein designated VGAM RNA, and which when bound by VGAM853 RNA causes inhibition of translation of respective one or more VGAM853 host target proteins.

[32725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM853 gene, herein designated VGAM GENE, on one or more VGAM853 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32726] It is yet further appreciated that a function of VGAM853 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM853 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM853 correlate with, and may be deduced from, the identity of the host target genes which VGAM853 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32727] Nucleotide sequences of the VGAM853 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM853 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM853 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM853 are further  
described hereinbelow with reference to Table 1.

[32728] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM853 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM853 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[32729] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM853 gene, herein designated VGAM is  
inhibition of expression of VGAM853 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM853 correlate with, and may be deduced  
from, the identity of the target genes which VGAM853  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[32730] LOC168512 (Accession XM\_095148) is a VGAM853 host  
target gene. LOC168512 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by LOC168512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168512 BINDING SITE, designated SEQ ID:40251, to the nucleotide sequence of VGAM853 RNA, herein designated VGAM RNA, also designated SEQ ID:3564.

[32731] A function of VGAM853 is therefore inhibition of LOC168512 (Accession XM\_095148). Accordingly, utilities of VGAM853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168512. LOC200059 (Accession XM\_114104) is another VGAM853 host target gene. LOC200059 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200059 BINDING SITE, designated SEQ ID:42699, to the nucleotide sequence of VGAM853 RNA, herein designated VGAM RNA, also designated SEQ ID:3564.

[32732] Another function of VGAM853 is therefore inhibition of

LOC200059 (Accession XM\_114104). Accordingly, utilities of VGAM853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200059. LOC81537 (Accession NM\_030791) is another VGAM853 host target gene. LOC81537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC81537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81537 BINDING SITE, designated SEQ ID:25087, to the nucleotide sequence of VGAM853 RNA, herein designated VGAM RNA, also designated SEQ ID:3564.

[32733] Another function of VGAM853 is therefore inhibition of LOC81537 (Accession NM\_030791). Accordingly, utilities of VGAM853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81537. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 854 (VGAM854) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[32734] VGAM854 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM854 was detected is described hereinabove with reference to Figs. 1–8.

[32735] VGAM854 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta Moorei Entomopoxvirus. VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32736] VGAM854 gene encodes a VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM854 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM854 precursor RNA is designated SEQ ID:840, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:840 is located at position 79626 relative to the genome of Amsacta Moorei Entomopoxvirus.

[32737] VGAM854 precursor RNA folds onto itself, forming VGAM854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[32738] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM854 folded precursor RNA into VGAM854 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 76%) nucleotide se-  
quence of VGAM854 RNA is designated SEQ ID:3565, and  
is provided hereinbelow with reference to the sequence  
listing part.

[32739] VGAM854 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM854 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM854 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32740] VGAM854 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM854 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM854 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[32741] The complementary binding of VGAM854 RNA, herein designated VGAM RNA, to host target binding sites on VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM854 host target RNA into VGAM854 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32742] It is appreciated that VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM854 host target genes. The mRNA of each one of this plurality of VGAM854 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM854 RNA, herein designated VGAM RNA, and which when bound by VGAM854 RNA causes inhibition of translation of respective one or more VGAM854 host target proteins.

[32743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM854 gene, herein designated VGAM GENE, on one or

more VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32744] It is yet further appreciated that a function of VGAM854 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of viral infection by Amsacta Moorei Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM854 correlate with, and may be deduced from, the identity of the host target genes which VGAM854 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [32745] Nucleotide sequences of the VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM854 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM854 are further described hereinbelow with reference to Table 1.
- [32746] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM854 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM854 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [32747] As mentioned hereinabove with reference to Fig. 1, a function of VGAM854 gene, herein designated VGAM is inhibition of expression of VGAM854 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM854 correlate with, and may be deduced from, the identity of the target genes which VGAM854 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [32748] Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession

NM\_022051) is a VGAM854 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22581, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32749] A function of VGAM854 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216.KIP2 (Accession NM\_006383) is another VGAM854 host target gene. KIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIP2 BINDING SITE, designated SEQ ID:13087, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32750] Another function of VGAM854 is therefore inhibition of KIP2 (Accession NM\_006383). Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIP2. Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM854 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17743, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32751] Another function of VGAM854 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-

phosphatase. Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336) is another VGAM854 host target gene. UBE2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2A BINDING SITE, designated SEQ ID:9340, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32752] Another function of VGAM854 is therefore inhibition of Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv-damaged dna. Accordingly, utilities of VGAM854 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with UBE2A. The function of UBE2A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM294. Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Accession NM\_003666) is another VGAM854 host target gene. BLZF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BLZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLZF1 BINDING SITE, designated SEQ ID:9749, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32753] Another function of VGAM854 is therefore inhibition of Basic Leucine Zipper Nuclear Factor 1 (JEM-1) (BLZF1, Accession NM\_003666). Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLZF1. FLJ20069 (Accession NM\_017651) is another VGAM854 host target gene. FLJ20069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ20069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20069 BINDING SITE, designated SEQ ID:19160, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32754] Another function of VGAM854 is therefore inhibition of FLJ20069 (Accession NM\_017651). Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20069. LCE (Accession NM\_024090) is another VGAM854 host target gene. LCE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LCE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCE BINDING SITE, designated SEQ ID:23533, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32755] Another function of VGAM854 is therefore inhibition of LCE (Accession NM\_024090). Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LCE.

LOC147219 (Accession XM\_097214) is another VGAM854 host target gene. LOC147219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147219 BINDING SITE, designated SEQ ID:40821, to the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, also designated SEQ ID:3565.

[32756] Another function of VGAM854 is therefore inhibition of LOC147219 (Accession XM\_097214). Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147219. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 855 (VGAM855) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32757] VGAM855 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM855 was detected is described hereinabove with reference to Figs. 1–8.

[32758] VGAM855 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32759] VGAM855 gene encodes a VGAM855 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM855 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM855 precursor RNA is designated SEQ ID:841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:841 is located at position 45064 relative to the genome of African Swine Fever Virus.

[32760] VGAM855 precursor RNA folds onto itself, forming VGAM855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32761] An enzyme complex designated DICER COMPLEX, `dices` the VGAM855 folded precursor RNA into VGAM855 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM855 RNA is designated SEQ ID:3566, and is provided hereinbelow with reference to the sequence listing part.

[32762] VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM855 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32763] VGAM855 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM855 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM855 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32764] The complementary binding of VGAM855 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM855 host target RNA into VGAM855 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32765] It is appreciated that VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM855 host target genes. The mRNA of each one of this plurality of VGAM855 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM855 RNA, herein designated VGAM RNA, and which when bound by VGAM855 RNA causes inhibition of translation of respective one or more VGAM855 host target proteins.

[32766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM855 gene, herein designated VGAM GENE, on one or more VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32767] It is yet further appreciated that a function of VGAM855 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM855 correlate with, and may be deduced from, the identity of the host target genes which VGAM855 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32768] Nucleotide sequences of the VGAM855 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM855 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM855 are further described hereinbelow with reference to Table 1.

[32769] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM855 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM855 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32770] As mentioned hereinabove with reference to Fig. 1, a function of VGAM855 gene, herein designated VGAM is inhibition of expression of VGAM855 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM855 correlate with, and may be deduced from, the identity of the target genes which VGAM855 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32771] Ets Homologous Factor (EHF, Accession NM\_012153) is a VGAM855 host target gene. EHF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by EHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHF BINDING SITE, designated SEQ ID:14451, to the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA, also designated SEQ ID:3566.

[32772] A function of VGAM855 is therefore inhibition of Ets Homologous Factor (EHF, Accession NM\_012153), a gene which is Member of the ESE subfamily of Ets transcription factors. Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHF. The function of EHF has been established by previous studies. By searching an EST database, Kas et al. (2000) identified an EST with sequence similarity to the ETS domain of human ESE1 (ELF3; 602191). They obtained a full-length cDNA encoding EHF, which they called ESE3, by using 5-prime RACE on human prostate cDNA. RT-PCR analysis identified 2 alternatively spliced forms of ESE3, ESE3a and ESE3b. Sequence analysis predicted that ESE3a encodes a 277-amino acid protein with a molecular mass of 32.3 kD, while ESE3b encodes a 300-amino acid protein with a molecular mass of

34.9 kD. The C-terminal ETS domain of ESE3 is 84% and 65% identical to the ETS domains of ESE1 and ESE2 (ELF5; 605169), respectively. Northern blot analysis detected a 5.9-kb ESE3 transcript in pancreas and prostate, with lower levels detected in kidney and colon. Dot blot analysis detected high levels of ESE3 expression in salivary gland, prostate, and trachea, with lower levels detected in colon, mammary gland, pancreas, lung, stomach, appendix, fetal kidney, and fetal lung. Using RT-PCR on primary and tumor-derived cell lines, the authors detected expression of ESE3 in tumor cells of epithelial origin. Gel-shift experiments showed binding of ESE3 to 3 high-affinity binding sites in the MET (OMIM Ref. No. 164860) promoter. Cotransfection of ESE3 expression vectors with a MET promoter-luciferase reporter construct demonstrated that both ESE3a and ESE3b act as transcriptional activators on this promoter. Kleinbaum et al. (1999) mapped the EHF gene to 11p12 by somatic cell hybrid analysis and FISH.

[32773] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32774] Kas, K.; Finger, E.; Grall, F.; Gu, X.; Akbarali, Y.; Boltax, J.;

Weiss, A.; Oettgen, P.; Kapeller, R.; Libermann, T. A. : ESE-3, a novel member of an epithelium-specific Ets transcription factor subfamily, demonstrates different target gene specificity from ESE-1. J. Biol. Chem. 275: 2986-2998, 2000. ; and

[32775] Kleinbaum, L. A.; Duggan, C.; Ferreira, E.; Coffey, G. P.; Buttice, G.; Burton, F. H. : Human chromosomal localization, tissue/tumor expression, and regulatory function of the ets fami.

[32776] Further studies establishing the function and utilities of EHF are found in John Hopkins OMIM database record ID 605439, and in cited publications numbered 4792-4793 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Estrogen Receptor 1 (ESR1, Accession NM\_000125) is another VGAM855 host target gene. ESR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESR1 BINDING SITE, designated SEQ ID:5598, to the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA, also designated SEQ ID:3566.

[32777] Another function of VGAM855 is therefore inhibition of Estrogen Receptor 1 (ESR1, Accession NM\_000125), a gene which involved in hormone-mediated inhibition of gene expression. Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESR1. The function of ESR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM695.FLJ11053 (Accession XM\_114194) is another VGAM855 host target gene. FLJ11053 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11053 BINDING SITE, designated SEQ ID:42776, to the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA, also designated SEQ ID:3566.

[32778] Another function of VGAM855 is therefore inhibition of FLJ11053 (Accession XM\_114194). Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11053.

FLJ11827 (Accession NM\_025093) is another VGAM855 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:24720, to the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA, also designated SEQ ID:3566.

[32779] Another function of VGAM855 is therefore inhibition of FLJ11827 (Accession NM\_025093). Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11827. LOC253664 (Accession XM\_170673) is another VGAM855 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45447, to the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA,

also designated SEQ ID:3566.

[32780] Another function of VGAM855 is therefore inhibition of LOC253664 (Accession XM\_170673). Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 856 (VGAM856) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32781] VGAM856 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM856 was detected is described hereinabove with reference to Figs. 1–8.

[32782] VGAM856 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32783] VGAM856 gene encodes a VGAM856 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM856 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM856 precursor RNA is designated SEQ ID:842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:842 is located at position 43493 relative to the genome of African Swine Fever Virus.

[32784] VGAM856 precursor RNA folds onto itself, forming VGAM856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32785] An enzyme complex designated DICER COMPLEX, `dices` the VGAM856 folded precursor RNA into VGAM856 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM856 RNA is designated SEQ ID:3567, and is provided hereinbelow with reference to the sequence listing part.

[32786] VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM856 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[32787] VGAM856 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM856 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM856 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32788] The complementary binding of VGAM856 RNA, herein designated VGAM RNA, to host target binding sites on VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM856 host target RNA into VGAM856 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32789] It is appreciated that VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM856 host target genes. The mRNA of

each one of this plurality of VGAM856 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM856 RNA, herein designated VGAM RNA, and which when bound by VGAM856 RNA causes inhibition of translation of respective one or more VGAM856 host target proteins.

[32790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM856 gene, herein designated VGAM GENE, on one or more VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32791] It is yet further appreciated that a function of VGAM856 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM856 correlate with, and may be deduced from, the identity of the host target genes which VGAM856 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32792] Nucleotide sequences of the VGAM856 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM856 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM856 are further described hereinbelow with reference to Table 1.

[32793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM856 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM856 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32794] As mentioned hereinabove with reference to Fig. 1, a function of VGAM856 gene, herein designated VGAM is inhibition of expression of VGAM856 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM856 correlate with, and may be deduced from, the identity of the target genes which VGAM856 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32795] Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696) is a VGAM856 host target gene. SPOCK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:31455, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32796] A function of VGAM856 is therefore inhibition of Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan

(testican) (SPOCK, Accession XM\_031696). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPOCK. BOP (Accession XM\_097915) is another VGAM856 host target gene. BOP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:41207, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32797] Another function of VGAM856 is therefore inhibition of BOP (Accession XM\_097915). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP. CHRNA7 (cholinergic receptor, nicotinic, alpha polypeptide 7, exons 5–10) and FAM7A (family with sequence similarity 7A, exons A–E) Fusion (CHRFAM7A, Accession XM\_170784) is another VGAM856 host target gene. CHRFAM7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CHRFAM7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRFAM7A BINDING SITE, designated SEQ ID:45552, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32798] Another function of VGAM856 is therefore inhibition of CHRNA7 (cholinergic receptor, nicotinic, alpha polypeptide 7, exons 5–10) and FAM7A (family with sequence similarity 7A, exons A–E) Fusion (CHRFAM7A, Accession XM\_170784). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRFAM7A. KIAA1416 (Accession XM\_098762) is another VGAM856 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41799, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ

ID:3567.

[32799] Another function of VGAM856 is therefore inhibition of KIAA1416 (Accession XM\_098762). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. LBP-9 (Accession NM\_014553) is another VGAM856 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15878, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32800] Another function of VGAM856 is therefore inhibition of LBP-9 (Accession NM\_014553). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. LOC132625 (Accession XM\_067946) is another VGAM856 host target gene. LOC132625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132625, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132625 BINDING SITE, designated SEQ ID:37371, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32801] Another function of VGAM856 is therefore inhibition of LOC132625 (Accession XM\_067946). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132625. LOC148811 (Accession XM\_086326) is another VGAM856 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:38597, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32802] Another function of VGAM856 is therefore inhibition of LOC148811 (Accession XM\_086326). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148811. LOC256733 (Accession XM\_173116) is another VGAM856 host target gene. LOC256733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256733 BINDING SITE, designated SEQ ID:46367, to the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32803] Another function of VGAM856 is therefore inhibition of LOC256733 (Accession XM\_173116). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256733. LOC90936 (Accession XM\_034953) is another VGAM856 host target gene. LOC90936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90936 BINDING SITE, designated SEQ ID:32188, to the

nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, also designated SEQ ID:3567.

[32804] Another function of VGAM856 is therefore inhibition of LOC90936 (Accession XM\_034953). Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90936. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 857 (VGAM857) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32805] VGAM857 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM857 was detected is described hereinabove with reference to Figs. 1–8.

[32806] VGAM857 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32807] VGAM857 gene encodes a VGAM857 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM857 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM857 precursor RNA is designated SEQ ID:843, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:843 is located at position 134388 relative to the genome of Ectromelia Virus.

[32808] VGAM857 precursor RNA folds onto itself, forming VGAM857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32809] An enzyme complex designated DICER COMPLEX, `dices` the VGAM857 folded precursor RNA into VGAM857 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM857 RNA is designated SEQ ID:3568, and is provided hereinbelow with reference to the sequence listing part.

[32810] VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM857 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32811] VGAM857 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM857 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM857 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[32812] The complementary binding of VGAM857 RNA, herein designated VGAM RNA, to host target binding sites on VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM857 host target RNA into VGAM857 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32813] It is appreciated that VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM857 host target genes. The mRNA of each one of this plurality of VGAM857 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM857 RNA, herein designated VGAM RNA, and which when bound by VGAM857 RNA causes inhibition of translation of respective one or more VGAM857 host target proteins.

[32814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM857 gene, herein designated VGAM GENE, on one or more VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[32815] It is yet further appreciated that a function of VGAM857 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM857 correlate with, and may be deduced from, the identity of the host target genes which VGAM857 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[32816] Nucleotide sequences of the VGAM857 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM857 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM857 are further described hereinbelow with reference to Table 1.

[32817] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM857 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM857 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32818] As mentioned hereinabove with reference to Fig. 1, a function of VGAM857 gene, herein designated VGAM is inhibition of expression of VGAM857 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM857 correlate with, and may be deduced from, the identity of the target genes which VGAM857 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32819] Endothelin 3 (EDN3, Accession NM\_000114) is a VGAM857 host target gene. EDN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDN3 BINDING SITE, designated SEQ ID:5583, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also designated SEQ ID:3568.

[32820] A function of VGAM857 is therefore inhibition of Endothelin 3 (EDN3, Accession NM\_000114). Accordingly, utilities

of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN3. DKFZP564F013 (Accession XM\_168479) is another VGAM857 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45203, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also designated SEQ ID:3568.

[32821] Another function of VGAM857 is therefore inhibition of DKFZP564F013 (Accession XM\_168479). Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. Epsin 2 (EPN2, Accession NM\_014964) is another VGAM857 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING

SITE, designated SEQ ID:17350, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also designated SEQ ID:3568.

[32822] Another function of VGAM857 is therefore inhibition of Epsin 2 (EPN2, Accession NM\_014964). Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. KIAA1486 (Accession XM\_041126) is another VGAM857 host target gene. KIAA1486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1486 BINDING SITE, designated SEQ ID:33463, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also designated SEQ ID:3568.

[32823] Another function of VGAM857 is therefore inhibition of KIAA1486 (Accession XM\_041126). Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486. Ubiquitin Specific Protease 15 (USP15, Accession NM\_006313) is another VGAM857 host target gene.

USP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP15 BINDING SITE, designated SEQ ID:13005, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also designated SEQ ID:3568.

[32824] Another function of VGAM857 is therefore inhibition of Ubiquitin Specific Protease 15 (USP15, Accession NM\_006313). Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP15. LOC152317 (Accession XM\_098189) is another VGAM857 host target gene. LOC152317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41468, to the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3568.

[32825] Another function of VGAM857 is therefore inhibition of LOC152317 (Accession XM\_098189). Accordingly, utilities of VGAM857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 858 (VGAM858) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32826] VGAM858 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM858 was detected is described hereinabove with reference to Figs. 1–8.

[32827] VGAM858 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32828] VGAM858 gene encodes a VGAM858 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM858 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM858 precursor RNA is designated SEQ ID:844, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:844 is located at position 132888 relative to the genome of Ectromelia Virus.

[32829] VGAM858 precursor RNA folds onto itself, forming VGAM858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32830] An enzyme complex designated DICER COMPLEX, `dices` the VGAM858 folded precursor RNA into VGAM858 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM858 RNA is designated SEQ ID:3569, and is provided hereinbelow with reference to the sequence listing part.

[32831] VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM858 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32832] VGAM858 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM858 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM858 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[32833] The complementary binding of VGAM858 RNA, herein designated VGAM RNA, to host target binding sites on VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM858 host target RNA into VGAM858 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32834] It is appreciated that VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM858 host target genes. The mRNA of

each one of this plurality of VGAM858 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM858 RNA, herein designated VGAM RNA, and which when bound by VGAM858 RNA causes inhibition of translation of respective one or more VGAM858 host target proteins.

[32835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM858 gene, herein designated VGAM GENE, on one or more VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32836] It is yet further appreciated that a function of VGAM858 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM858 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM858 correlate with, and may be deduced from, the identity of the host target genes which VGAM858 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32837] Nucleotide sequences of the VGAM858 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM858 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM858 are further described hereinbelow with reference to Table 1.

[32838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM858 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM858 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32839] As mentioned hereinabove with reference to Fig. 1, a function of VGAM858 gene, herein designated VGAM is inhibition of expression of VGAM858 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM858 correlate with, and may be deduced from, the identity of the target genes which VGAM858 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32840] KIAA0143 (Accession XM\_035825) is a VGAM858 host target gene. KIAA0143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0143 BINDING SITE, designated SEQ ID:32351, to the nucleotide sequence of VGAM858 RNA, herein designated VGAM RNA, also designated SEQ ID:3569.

[32841] A function of VGAM858 is therefore inhibition of KIAA0143 (Accession XM\_035825). Accordingly, utilities of VGAM858 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0143. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832) is another VGAM858 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27417, to the nucleotide sequence of VGAM858 RNA, herein designated VGAM RNA, also designated SEQ ID:3569.

[32842] Another function of VGAM858 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832). Accordingly, utilities of VGAM858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. LOC158292 (Accession XM\_098914) is another VGAM858 host target gene. LOC158292 BINDING SITE1 and LOC158292 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC158292, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE1 and LOC158292 BINDING SITE2, designated SEQ ID:41934 and SEQ ID:41935 respectively, to the nucleotide sequence of VGAM858 RNA, herein designated VGAM RNA, also designated SEQ ID:3569.

[32843] Another function of VGAM858 is therefore inhibition of LOC158292 (Accession XM\_098914). Accordingly, utilities of VGAM858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 859 (VGAM859) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32844] VGAM859 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM859 was detected is described hereinabove with reference to Figs. 1–8.

[32845] VGAM859 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32846] VGAM859 gene encodes a VGAM859 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM859 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM859 precursor RNA is designated SEQ ID:845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:845 is located at position 126158 relative to the genome of Camelpox Virus.

[32847] VGAM859 precursor RNA folds onto itself, forming VGAM859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32848] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM859 folded precursor RNA into VGAM859 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM859 RNA is designated SEQ ID:3570, and is provided hereinbelow with reference to the sequence listing part.

[32849] VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM859 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32850] VGAM859 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM859 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM859 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32851] The complementary binding of VGAM859 RNA, herein designated VGAM RNA, to host target binding sites on VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM859 host target RNA into VGAM859 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32852] It is appreciated that VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM859 host target genes. The mRNA of each one of this plurality of VGAM859 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM859 RNA, herein designated VGAM RNA, and which when bound by VGAM859 RNA causes inhibition of translation of respective one or more VGAM859 host target proteins.

[32853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM859 gene, herein designated VGAM GENE, on one or more VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32854] It is yet further appreciated that a function of VGAM859 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM859 correlate with, and may be deduced from, the identity of the host target genes which VGAM859 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32855] Nucleotide sequences of the VGAM859 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM859 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM859 are further described hereinbelow with reference to Table 1.

[32856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM859 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM859 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32857] As mentioned hereinabove with reference to Fig. 1, a function of VGAM859 gene, herein designated VGAM is inhibition of expression of VGAM859 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM859 correlate with, and may be deduced from, the identity of the target genes which VGAM859 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32858] A Disintegrin and Metalloproteinase Domain 22 (ADAM22, Accession NM\_021722) is a VGAM859 host target gene. ADAM22 BINDING SITE1 and ADAM22 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM22, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM22 BIND-

ING SITE1 and ADAM22 BINDING SITE2, designated SEQ ID:22323 and SEQ ID:22325 respectively, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32859] A function of VGAM859 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 22 (ADAM22, Accession NM\_021722), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM22. The function of ADAM22 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM81. Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM\_087256) is another VGAM859 host target gene. KPNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA1 BINDING SITE, designated SEQ ID:39150, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ

ID:3570.

[32860] Another function of VGAM859 is therefore inhibition of Karyopherin Alpha 1 (importin alpha 5) (KPNA1, Accession XM\_087256), a gene which promotes docking of import substrates to the nuclear pore complex. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA1. The function of KPNA1 has been established by previous studies. Cortes et al. (1994) used the 2-hybrid protein interaction systems to isolate a protein that specifically interacts with RAG1 (OMIM Ref. No. 179615). The genes RAG1 and RAG2 (OMIM Ref. No. 179616) are able to activate V(D)J recombination when transfected into fibroblasts. Further, knockout mice for these 2 loci lack B and T cells. Several other ubiquitously expressed proteins are thought to be recruited in the recombination process. Among these are the genes affected in severe combined immune deficiency (e.g., OMIM Ref. No. also 600899) and genes involved in ds-DNA break repair. The human cDNA identified by Cortes et al. (1994) encodes a 489-amino acid polypeptide that shows striking similarity to the yeast SRP1 protein, a mutant allele which can suppress a mutation of RNA polymerase I. The authors obtained human

and mouse cDNA sequences which are 98% identical as proteins. When RAG1 and human SRP1 were cotransfected into 293T cells a stable complex of the 2 was observed. The authors speculated that because SRP1 appears to be bound to the nuclear envelope, the interaction with RAG1 may serve to localize that protein to the envelope as well. Conti et al. (1998) reported the crystal structure of a 50-kD fragment of the 60-kD yeast karyopherin alpha, in the absence and presence of a monopartite nuclear localization signal (NLS) peptide at 2.2-angstrom and 2.8-angstrom resolution, respectively. The structure showed a tandem array of 10 armadillo repeats, organized in a right-handed superhelix of helices. Binding of the NLS peptide occurred at 2 sites within a helical surface groove. The structure reveals the determinants of NLS specificity and suggested a model for the recognition of bipartite NLSs. By fluorescence in situ hybridization, Ayala-Madrigal et al. (2000) mapped the human KPNA1 gene to chromosome 3q21.

[32861] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32862] Ayala-Madrigal, M. L.; Doerr, S.; Ramirez-Duenas, M. L.;

Hansmann, I. : Assignment of karyopherin alpha 1 (KPNA1) to human chromosome band 3q21 by in situ hybridization. Cytogenet. Cell Genet. 90: 58–59, 2000. ; and

[32863] Conti, E.; Uy, M.; Leighton, L.; Blobel, G.; Kuriyan, J. : Crystallographic analysis of the recognition of a nuclear localization signal by the nuclear import factor karyopherin alpha.

[32864] Further studies establishing the function and utilities of KPNA1 are found in John Hopkins OMIM database record ID 600686, and in cited publications numbered 9973–9975 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Procollagen–proline, 2–oxoglutarate 4–dioxygenase (proline 4–hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM\_000917) is another VGAM859 host target gene. P4HA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P4HA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HA1 BINDING SITE, designated SEQ ID:6624, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ

ID:3570.

[32865] Another function of VGAM859 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM\_000917), a gene which catalyzes the formation of 4-hydroxyproline in collagen. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HA1. The function of P4HA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038) is another VGAM859 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8999, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32866] Another function of VGAM859 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 has been established by previous studies. In a screening for cDNAs encoding proteins similar to the sodium-coupled glutamate transporter GLAST1, Hofmann et al. (1994) isolated a cDNA clone encoding a protein that turned out to be identical to the neutral amino acid transporter ASCT1 (Arriza et al., 1993; Shafqat et al., 1993). The new member of the GLAST-related transporter family did not transport glutamate or aspartate but alanine, serine, cysteine, and threonine instead. The open reading frame of 1,572 basepairs encodes 524 amino acid residues distributed over 8 exons spanning at least 40 kb of genomic DNA. The gene for ASCT1, designated SLC1A4, was assigned to 2p15-p13 by fluorescence in situ hybridization. The gene structure was not related to any previously characterized transporter gene. Zerangue and Kavanaugh (1996) found that the

ASCT1 transporter functions primarily as an amino acid exchanger. Transport is associated with a chloride channel activity that is thermodynamically uncoupled from amino acid transport.

[32867] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32868] Arriza, J. L.; Kavanaugh, M. P.; Fairman, W. A.; Wu, Y.-N.; Murdoch, G. H.; North, R. A.; Amara, S. G. : Cloning and expression of a human neutral amino acid transporter with structural similarity to the glutamate transporter gene family. J. Biol. Chem. 268: 15329–15332, 1993. ; and

[32869] Zerangue, N.; Kavanaugh, M. P. : ASCT–1 is a neutral amino acid exchanger with chloride channel activity. J. Biol. Chem. 271: 27991–27994, 1996.

[32870] Further studies establishing the function and utilities of SLC1A4 are found in John Hopkins OMIM database record ID 600229, and in cited publications numbered 7556–7559 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714) is another VGAM859 host target

gene. C20orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf13 BINDING SITE, designated SEQ ID:19298, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32871] Another function of VGAM859 is therefore inhibition of Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf13. DIS3 (Accession NM\_014953) is another VGAM859 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17305, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32872] Another function of VGAM859 is therefore inhibition of DIS3 (Accession NM\_014953). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. DKFZp547A023 (Accession XM\_052065) is another VGAM859 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35945, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32873] Another function of VGAM859 is therefore inhibition of DKFZp547A023 (Accession XM\_052065). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. FLJ13072 (Accession XM\_117117) is another VGAM859 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43237, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32874] Another function of VGAM859 is therefore inhibition of FLJ13072 (Accession XM\_117117). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. FLJ22794 (Accession XM\_166220) is another VGAM859 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44038, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32875] Another function of VGAM859 is therefore inhibition of FLJ22794 (Accession XM\_166220). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794.

Zinc Finger Protein 197 (ZNF197, Accession NM\_006991) is another VGAM859 host target gene. ZNF197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF197 BINDING SITE, designated SEQ ID:13855, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32876] Another function of VGAM859 is therefore inhibition of Zinc Finger Protein 197 (ZNF197, Accession NM\_006991). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF197. LOC115297 (Accession XM\_053313) is another VGAM859 host target gene. LOC115297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115297 BINDING SITE, designated SEQ ID:36073, to the nucleotide sequence of

VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32877] Another function of VGAM859 is therefore inhibition of LOC115297 (Accession XM\_053313). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC145790 (Accession XM\_085234) is another VGAM859 host target gene. LOC145790 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145790 BINDING SITE, designated SEQ ID:37980, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32878] Another function of VGAM859 is therefore inhibition of LOC145790 (Accession XM\_085234). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145790. LOC145951 (Accession XM\_085283) is another VGAM859 host target gene. LOC145951 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145951 BINDING SITE, designated SEQ ID:38017, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32879] Another function of VGAM859 is therefore inhibition of LOC145951 (Accession XM\_085283). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145951. LOC152220 (Accession XM\_098176) is another VGAM859 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41446, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32880] Another function of VGAM859 is therefore inhibition of LOC152220 (Accession XM\_098176). Accordingly, utilities

of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC199678 (Accession XM\_117111) is another VGAM859 host target gene. LOC199678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199678 BINDING SITE, designated SEQ ID:43228, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32881] Another function of VGAM859 is therefore inhibition of LOC199678 (Accession XM\_117111). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199678. LOC254896 (Accession XM\_171201) is another VGAM859 host target gene. LOC254896 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254896, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254896 BINDING SITE, designated SEQ ID:45989, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32882] Another function of VGAM859 is therefore inhibition of LOC254896 (Accession XM\_171201). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254896. LOC257478 (Accession XM\_054745) is another VGAM859 host target gene. LOC257478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257478 BINDING SITE, designated SEQ ID:36184, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32883] Another function of VGAM859 is therefore inhibition of LOC257478 (Accession XM\_054745). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257478. LOC57147 (Accession NM\_020423) is another VGAM859 host target gene. LOC57147 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57147 BINDING SITE, designated SEQ ID:21681, to the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, also designated SEQ ID:3570.

[32884] Another function of VGAM859 is therefore inhibition of LOC57147 (Accession NM\_020423). Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57147. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 860 (VGAM860) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32885] VGAM860 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM860 was detected is described hereinabove with reference to Figs. 1–8.

[32886] VGAM860 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32887] VGAM860 gene encodes a VGAM860 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM860 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM860 precursor RNA is designated SEQ ID:846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:846 is located at position 127064 relative to the genome of Camelpox Virus.

[32888] VGAM860 precursor RNA folds onto itself, forming VGAM860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[32889] An enzyme complex designated DICER COMPLEX, `dices` the VGAM860 folded precursor RNA into VGAM860 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM860 RNA is designated SEQ ID:3571, and is provided hereinbelow with reference to the sequence listing part.

[32890] VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM860 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32891] VGAM860 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM860 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM860 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM860 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32892] The complementary binding of VGAM860 RNA, herein designated VGAM RNA, to host target binding sites on VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM860 host target RNA into VGAM860 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32893] It is appreciated that VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM860 host target genes. The mRNA of each one of this plurality of VGAM860 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM860 RNA, herein designated VGAM RNA, and which when bound by VGAM860 RNA causes inhibition of translation of respective one or more VGAM860 host target proteins.

[32894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM860 gene, herein designated VGAM GENE, on one or more VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32895] It is yet further appreciated that a function of VGAM860 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM860 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM860 correlate with, and may be deduced from, the identity of the host target genes which VGAM860 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32896] Nucleotide sequences of the VGAM860 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM860 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM860 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM860 are further described hereinbelow with reference to Table 1.

[32897] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM860 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM860 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32898] As mentioned hereinabove with reference to Fig. 1, a function of VGAM860 gene, herein designated VGAM is inhibition of expression of VGAM860 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM860 correlate with, and may be deduced from, the identity of the target genes which VGAM860 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32899] KIAA0143 (Accession XM\_035825) is a VGAM860 host target gene. KIAA0143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0143 BINDING SITE, designated SEQ ID:32351, to the nucleotide sequence of VGAM860 RNA, herein designated VGAM RNA, also designated SEQ ID:3571.

[32900] A function of VGAM860 is therefore inhibition of KIAA0143 (Accession XM\_035825). Accordingly, utilities of VGAM860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0143. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832) is another VGAM860 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27417, to the nucleotide sequence of VGAM860 RNA, herein designated VGAM RNA, also designated SEQ ID:3571.

[32901] Another function of VGAM860 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832). Accordingly, utilities of VGAM860 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SLC26A7. LOC158292 (Accession XM\_098914) is another VGAM860 host target gene. LOC158292 BINDING SITE1 and LOC158292 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC158292, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE1 and LOC158292 BINDING SITE2, designated SEQ ID:41934 and SEQ ID:41935 respectively, to the nucleotide sequence of VGAM860 RNA, herein designated VGAM RNA, also designated SEQ ID:3571.

[32902] Another function of VGAM860 is therefore inhibition of LOC158292 (Accession XM\_098914). Accordingly, utilities of VGAM860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 861 (VGAM861) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[32903] VGAM861 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM861 was detected is described hereinabove with reference to Figs. 1–8.

[32904] VGAM861 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32905] VGAM861 gene encodes a VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM861 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM861 precursor RNA is designated SEQ ID:847, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:847 is located at position 97141 relative to the genome of Ictalurid Herpesvirus 1.

[32906] VGAM861 precursor RNA folds onto itself, forming VGAM861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[32907] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM861 folded precursor RNA into VGAM861 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 45%) nucleotide se-  
quence of VGAM861 RNA is designated SEQ ID:3572, and  
is provided hereinbelow with reference to the sequence  
listing part.

[32908] VGAM861 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM861 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM861 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32909] VGAM861 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM861 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM861 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[32910] The complementary binding of VGAM861 RNA, herein designated VGAM RNA, to host target binding sites on VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM861 host target RNA into VGAM861 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32911] It is appreciated that VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM861 host target genes. The mRNA of each one of this plurality of VGAM861 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM861 RNA, herein designated VGAM RNA, and which when bound by VGAM861 RNA causes inhibition of translation of respective one or more VGAM861 host target proteins.

[32912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM861 gene, herein designated VGAM GENE, on one or

more VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32913] It is yet further appreciated that a function of VGAM861 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM861 correlate with, and may be deduced from, the identity of the host target genes which VGAM861 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [32914] Nucleotide sequences of the VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM861 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM861 are further described hereinbelow with reference to Table 1.
- [32915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM861 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM861 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [32916] As mentioned hereinabove with reference to Fig. 1, a function of VGAM861 gene, herein designated VGAM is inhibition of expression of VGAM861 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM861 correlate with, and may be deduced from, the identity of the target genes which VGAM861 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [32917] Estrogen-related Receptor Gamma (ESRRG, Accession

XM\_039053) is a VGAM861 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:33001, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32918] A function of VGAM861 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359. Glypican 4 (GPC4, Accession NM\_001448) is another VGAM861 host target gene. GPC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC4 BINDING SITE, designated SEQ ID:7179, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32919] Another function of VGAM861 is therefore inhibition of Glypican 4 (GPC4, Accession NM\_001448), a gene which may play a role in growth control and cell division. Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC4. The function of GPC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Kinase Insert Domain Receptor (a type III receptor tyrosine kinase) (KDR, Accession NM\_002253) is another VGAM861 host target gene. KDR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KDR BINDING SITE, designated SEQ ID:8055, to the nucleotide sequence of VGAM861 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3572.

[32920] Another function of VGAM861 is therefore inhibition of Kinase Insert Domain Receptor (a type III receptor tyrosine kinase) (KDR, Accession NM\_002253). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KDR. Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_006800) is another VGAM861 host target gene. MSL3L1 BINDING SITE1 through MSL3L1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MSL3L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE1 through MSL3L1 BINDING SITE3, designated SEQ ID:13673, SEQ ID:27813 and SEQ ID:27816 respectively, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32921] Another function of VGAM861 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM\_006800). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with MSL3L1. Sp3 Transcription Factor (SP3, Accession XM\_092672) is another VGAM861 host target gene. SP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP3 BINDING SITE, designated SEQ ID:40136, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32922] Another function of VGAM861 is therefore inhibition of Sp3 Transcription Factor (SP3, Accession XM\_092672), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP3. The function of SP3 has been established by previous studies. Kingsley and Winoto (1992) noted that in T cells, a consensus GT box similar to the GC box is bound by Sp1. Gel shift analysis showed that other regulatory proteins also bind the GT box. They then cloned 2 novel cDNAs using the Sp1 zinc finger domain as a probe. These new transcription factors, termed Sp2

(OMIM Ref. No. 601801) and Sp3 by them, encode proteins with several transactivation domains and a zinc finger DNA-binding domain with homology to Sp1. The Sp3 cDNA encodes an open reading frame of 713 amino acids. They found that the amino acid sequence of Sp3 is 90% homologous to that of Sp1 within the zinc finger region, and that there is significant homology throughout the protein. Kingsley and Winoto (1992) found that, when expressed in vitro, both Sp1 and Sp3 bind strongly to GC- and GT-box regulatory elements. Hagen et al. (1992) independently performed recognition site screening for factors which bind to the GT motif of the uteroglobin promoter. They isolated Sp3 and Sp4 (OMIM Ref. No. 600540), referring to them as SPR2 and SPR1 (for Sp-related factors 2 and 1) respectively. Northern blot analysis showed that Sp3 is expressed as a 5.0-kb message in all cell lines and tissues tested. Hagen et al. (1994) found that Sp3 represses Sp1-mediated transcriptional activation, suggesting that Sp3 is an inhibitory member of the Sp gene family.

[32923] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [32924] Kalff-Suske, M.; Kunz, J.; Grzeschik, K.-H.; Suske, G. : Human Sp3 transcriptional regulator gene (SP3) maps to chromosome 2q31. *Genomics* 37: 410–412, 1996. ; and
- [32925] Hagen, G.; Muller, S.; Beato, M.; Suske, G. : Cloning by recognition site screening of two novel GT box binding proteins: a family of Sp1 related genes. *Nucleic Acids Res.* 20: 5519–5525, 19.
- [32926] Further studies establishing the function and utilities of SP3 are found in John Hopkins OMIM database record ID 601804, and in cited publications numbered 7689–916 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM\_032945) is another VGAM861 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31802, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32927] Another function of VGAM861 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM\_032945). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25.

FLJ21106 (Accession NM\_025097) is another VGAM861 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24736, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32928] Another function of VGAM861 is therefore inhibition of FLJ21106 (Accession NM\_025097). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. KIAA0427 (Accession NM\_014772) is another VGAM861 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16582, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32929] Another function of VGAM861 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620) is another VGAM861 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35019, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32930] Another function of VGAM861 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I,

Gamma (PIP5K1C, Accession XM\_047620). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. Target of Myb1 (chicken) (TOM1, Accession NM\_005488) is another VGAM861 host target gene. TOM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1 BINDING SITE, designated SEQ ID:11988, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32931] Another function of VGAM861 is therefore inhibition of Target of Myb1 (chicken) (TOM1, Accession NM\_005488). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOM1. LOC116028 (Accession XM\_057225) is another VGAM861 host target gene. LOC116028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116028 BINDING SITE, designated SEQ ID:36494, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32932] Another function of VGAM861 is therefore inhibition of LOC116028 (Accession XM\_057225). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116028. LOC150848 (Accession XM\_097959) is another VGAM861 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41260, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32933] Another function of VGAM861 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150848. LOC257471 (Accession XM\_171020) is another VGAM861 host target gene. LOC257471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257471 BINDING SITE, designated SEQ ID:45788, to the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, also designated SEQ ID:3572.

[32934] Another function of VGAM861 is therefore inhibition of LOC257471 (Accession XM\_171020). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257471. LOC51696 (Accession NM\_016217) is another VGAM861 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18318, to the nucleotide sequence of VGAM861 RNA, herein designated

VGAM RNA, also designated SEQ ID:3572.

[32935] Another function of VGAM861 is therefore inhibition of LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 862 (VGAM862) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32936] VGAM862 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM862 was detected is described hereinabove with reference to Figs. 1–8.

[32937] VGAM862 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32938] VGAM862 gene encodes a VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM862 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM862 precursor RNA is designated SEQ ID:848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:848 is located at position 97256 relative to the genome of Ictalurid Herpesvirus 1.

[32939] VGAM862 precursor RNA folds onto itself, forming VGAM862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32940] An enzyme complex designated DICER COMPLEX, `dices` the VGAM862 folded precursor RNA into VGAM862 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM862 RNA is designated SEQ ID:3573, and is provided hereinbelow with reference to the sequence listing part.

[32941] VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM862 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[32942] VGAM862 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM862 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM862 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[32943] The complementary binding of VGAM862 RNA, herein designated VGAM RNA, to host target binding sites on VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM862 host target RNA into VGAM862 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32944] It is appreciated that VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM862 host target genes. The mRNA of

each one of this plurality of VGAM862 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM862 RNA, herein designated VGAM RNA, and which when bound by VGAM862 RNA causes inhibition of translation of respective one or more VGAM862 host target proteins.

[32945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM862 gene, herein designated VGAM GENE, on one or more VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[32946] It is yet further appreciated that a function of VGAM862 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM862 correlate with, and may be deduced from, the identity of the host target genes which VGAM862 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32947] Nucleotide sequences of the VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM862 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM862 are further described hereinbelow with reference to Table 1.

[32948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM862 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM862 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[32949] As mentioned hereinabove with reference to Fig. 1, a function of VGAM862 gene, herein designated VGAM is inhibition of expression of VGAM862 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM862 correlate with, and may be deduced from, the identity of the target genes which VGAM862 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32950] BLTR2 (Accession NM\_019839) is a VGAM862 host target gene. BLTR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BLTR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLTR2 BINDING SITE, designated SEQ ID:21242, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32951] A function of VGAM862 is therefore inhibition of BLTR2 (Accession NM\_019839). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BLTR2. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423) is another VGAM862 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10691, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32952] Another function of VGAM862 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464) is another VGAM862 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in

untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10772 and SEQ ID:26999 respectively, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32953] Another function of VGAM862 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Solute Carrier Family 8 (sodium-calcium exchanger), Member 2 (SLC8A2, Accession XM\_038970) is another VGAM862 host target gene. SLC8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC8A2 BINDING SITE, designated SEQ ID:32966, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32954] Another function of VGAM862 is therefore inhibition of Solute Carrier Family 8 (sodium–calcium exchanger), Member 2 (SLC8A2, Accession XM\_038970). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC8A2. Small Optic Lobes Homolog (*Drosophila*) (SOLH, Accession NM\_005632) is another VGAM862 host target gene. SOLH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SOLH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOLH BINDING SITE, designated SEQ ID:12163, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32955] Another function of VGAM862 is therefore inhibition of Small Optic Lobes Homolog (*Drosophila*) (SOLH, Accession

NM\_005632), a gene which has several domains (calpain-like domain, zinc fingers) and homologous to the *Drosophila sol*. Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOLH. The function of SOLH has been established by previous studies. The *Drosophila* small optic lobes (*sol*) gene encodes a protein with zinc finger-like repeats, a calpain (see OMIM Ref. No. 114240)-like protease domain, and a C-terminal region of unknown function. Mutations in *sol* cause a severe reduction in the cell numbers of the neuropiles of the medulla and lobula complexes of the adult optic lobes. Banfi et al. (1996) identified a human EST encoding a protein with homology to the *sol* gene product. By screening human brain cDNA libraries with this EST, Kamei et al. (1998) isolated cDNAs corresponding to the complete coding sequence of SOLH. The predicted 1,086-amino acid protein shares 44% sequence identity with *sol*. The calpain-like domain and C-terminal region are highly conserved between SOLH and *sol*, and similar zinc fingers are present in the N-terminal regions of these proteins. The SOLH gene contains at least 14 exons distributed over more than 45 kb. Southern blot analysis indicated that SOLH is a

single-copy gene. Using Northern blots, the authors demonstrated that SOLH is expressed as an approximately 5-kb mRNA in various human tissues; additional smaller transcripts were observed in some tissues. Kamei et al. (1998) identified cDNAs and genomic clones encoding mouse, *C. elegans*, and *Fugu rubripes* (Japanese pufferfish) homologs of sol.

[32956] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[32957] Banfi, S.; Borsani, G.; Rossi, E.; Bernard, L.; Guffanti, A.; Rubboli, F.; Marchitello, A.; Giglio, S.; Coluccia, E.; Zollo, M.; Zuffardi, O.; Ballabio, A. : Identification and mapping of human cDNAs homologous to *Drosophila* mutant genes through EST database searching. *Nature Genet.* 13: 167–174, 1996. ; and

[32958] Kamei, M.; Webb, G. C.; Young, I. G.; Campbell, H. D. : SOLH, a human homologue of the *Drosophila melanogaster* small optic lobes gene is a member of the calpain and zinc-finger gene famili.

[32959] Further studies establishing the function and utilities of SOLH are found in John Hopkins OMIM database record ID 603267, and in sited publications numbered 602 and

6331 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ12816 (Accession NM\_022060) is another VGAM862 host target gene. FLJ12816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12816 BINDING SITE, designated SEQ ID:22602, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32960] Another function of VGAM862 is therefore inhibition of FLJ12816 (Accession NM\_022060). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12816. FLJ22471 (Accession NM\_025140) is another VGAM862 host target gene. FLJ22471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22471 BINDING SITE,

designated SEQ ID:24777, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32961] Another function of VGAM862 is therefore inhibition of FLJ22471 (Accession NM\_025140). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22471. KIAA1322 (Accession XM\_052626) is another VGAM862 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36020, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32962] Another function of VGAM862 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. PRO0097 (Accession NM\_014114) is another VGAM862 host target gene. PRO0097 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15364, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32963] Another function of VGAM862 is therefore inhibition of PRO0097 (Accession NM\_014114). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0097. ZFP106 (Accession NM\_022473) is another VGAM862 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22829, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32964] Another function of VGAM862 is therefore inhibition of

ZFP106 (Accession NM\_022473). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC150397 (Accession XM\_086907) is another VGAM862 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38959, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32965] Another function of VGAM862 is therefore inhibition of LOC150397 (Accession XM\_086907). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC163682 (Accession XM\_099402) is another VGAM862 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42086, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32966] Another function of VGAM862 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC222171 (Accession XM\_166586) is another VGAM862 host target gene. LOC222171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222171 BINDING SITE, designated SEQ ID:44558, to the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, also designated SEQ ID:3573.

[32967] Another function of VGAM862 is therefore inhibition of LOC222171 (Accession XM\_166586). Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222171. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 863 (VGAM863) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32968] VGAM863 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM863 was detected is described hereinabove with reference to Figs. 1–8.

[32969] VGAM863 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32970] VGAM863 gene encodes a VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM863 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM863 precursor RNA is designated SEQ ID:849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:849 is

located at position 99448 relative to the genome of Ictalurid Herpesvirus 1.

[32971] VGAM863 precursor RNA folds onto itself, forming VGAM863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32972] An enzyme complex designated DICER COMPLEX, `dices` the VGAM863 folded precursor RNA into VGAM863 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM863 RNA is designated SEQ ID:3574, and is provided hereinbelow with reference to the sequence listing part.

[32973] VGAM863 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM863 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[32974] VGAM863 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM863 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM863 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM863 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[32975] The complementary binding of VGAM863 RNA, herein designated VGAM RNA, to host target binding sites on VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM863 host target RNA into VGAM863 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[32976] It is appreciated that VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM863 host target genes. The mRNA of each one of this plurality of VGAM863 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM863 RNA, herein designated VGAM RNA, and which when bound by VGAM863 RNA causes inhibition of translation of respective one or more VGAM863

host target proteins.

[32977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM863 gene, herein designated VGAM GENE, on one or more VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[32978] It is yet further appreciated that a function of VGAM863 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM863 correlate with, and may be deduced from, the identity of the host target genes which VGAM863 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[32979] Nucleotide sequences of the VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM863 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM863 are further described hereinbelow with reference to Table 1.

[32980] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM863 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM863 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[32981] As mentioned hereinabove with reference to Fig. 1, a function of VGAM863 gene, herein designated VGAM is inhibition of expression of VGAM863 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM863 correlate with, and may be deduced from, the identity of the target genes which VGAM863 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[32982] Axin 1 (AXIN1, Accession XM\_027520) is a VGAM863 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30513, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32983] A function of VGAM863 is therefore inhibition of Axin 1 (AXIN1, Accession XM\_027520). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM\_013995) is another VGAM863 host target gene. LAMP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMP2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP2 BINDING SITE, designated SEQ ID:15182, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32984] Another function of VGAM863 is therefore inhibition of Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM\_013995). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP2. Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM\_000595) is another VGAM863 host target gene. LTA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:6193, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32985] Another function of VGAM863 is therefore inhibition of Lymphotoxin Alpha (TNF superfamily, member 1) (LTA,

Accession NM\_000595), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfr and tnfrsf14/hvem. Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA. The function of LTA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM662. ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM\_080283) is another VGAM863 host target gene. ABCA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA9 BINDING SITE, designated SEQ ID:27826, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32986] Another function of VGAM863 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM\_080283). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ABCA9. FASTK (Accession NM\_025096) is another VGAM863 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24726, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32987] Another function of VGAM863 is therefore inhibition of FASTK (Accession NM\_025096). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK. FLJ14437 (Accession NM\_032578) is another VGAM863 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26306, to the nucleotide sequence of

VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32988] Another function of VGAM863 is therefore inhibition of FLJ14437 (Accession NM\_032578). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. KIAA0125 (Accession XM\_018203) is another VGAM863 host target gene. KIAA0125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:30344, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32989] Another function of VGAM863 is therefore inhibition of KIAA0125 (Accession XM\_018203). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. KIAA1505 (Accession XM\_168469) is another VGAM863 host target gene. KIAA1505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA1505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:45191, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32990] Another function of VGAM863 is therefore inhibition of KIAA1505 (Accession XM\_168469). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. MGC39436 (Accession NM\_144673) is another VGAM863 host target gene. MGC39436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC39436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC39436 BINDING SITE, designated SEQ ID:29495, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32991] Another function of VGAM863 is therefore inhibition of MGC39436 (Accession NM\_144673). Accordingly, utilities

of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC39436. NYD-SP27 (Accession NM\_033123) is another VGAM863 host target gene. NYD-SP27 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NYD-SP27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP27 BINDING SITE, designated SEQ ID:26967, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32992] Another function of VGAM863 is therefore inhibition of NYD-SP27 (Accession NM\_033123). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP27. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_139195) is another VGAM863 host target gene. ST7L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ST7L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ST7L BINDING SITE, designated SEQ ID:29203, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32993] Another function of VGAM863 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_139195). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. LOC158434 (Accession XM\_098939) is another VGAM863 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41981, to the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, also designated SEQ ID:3574.

[32994] Another function of VGAM863 is therefore inhibition of LOC158434 (Accession XM\_098939). Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 864 (VGAM864) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[32995] VGAM864 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM864 was detected is described hereinabove with reference to Figs. 1–8.

[32996] VGAM864 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid Herpesvirus 1. VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[32997] VGAM864 gene encodes a VGAM864 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM864 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM864 precursor RNA is designated SEQ ID:850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:850 is

located at position 96883 relative to the genome of Ictalurid Herpesvirus 1.

[32998] VGAM864 precursor RNA folds onto itself, forming VGAM864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[32999] An enzyme complex designated DICER COMPLEX, `dices` the VGAM864 folded precursor RNA into VGAM864 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM864 RNA is designated SEQ ID:3575, and is provided hereinbelow with reference to the sequence listing part.

[33000] VGAM864 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM864 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33001] VGAM864 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM864 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM864 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM864 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[33002] The complementary binding of VGAM864 RNA, herein designated VGAM RNA, to host target binding sites on VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM864 host target RNA into VGAM864 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33003] It is appreciated that VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM864 host target genes. The mRNA of each one of this plurality of VGAM864 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM864 RNA, herein designated VGAM RNA, and which when bound by VGAM864 RNA causes inhibition of translation of respective one or more VGAM864

host target proteins.

[33004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM864 gene, herein designated VGAM GENE, on one or more VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33005] It is yet further appreciated that a function of VGAM864 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of viral infection by Ictalurid Herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM864 correlate with, and may be deduced from, the identity of the host target genes which VGAM864 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33006] Nucleotide sequences of the VGAM864 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM864 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM864 are further described hereinbelow with reference to Table 1.
- [33007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM864 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM864 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33008] As mentioned hereinabove with reference to Fig. 1, a function of VGAM864 gene, herein designated VGAM is inhibition of expression of VGAM864 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM864 correlate with, and may be deduced from, the identity of the target genes which VGAM864 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33009] Fibroblast Growth Factor 9 (glia-activating factor) (FGF9, Accession NM\_002010) is a VGAM864 host target gene. FGF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF9 BINDING SITE, designated SEQ ID:7751, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33010] A function of VGAM864 is therefore inhibition of Fibroblast Growth Factor 9 (glia-activating factor) (FGF9, Accession NM\_002010), a gene which Fibroblast growth factor 9 (glia-activating factor); secreted mitogen. Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF9. The function of FGF9 has been established by previous studies. Members of the fibroblast growth factor (FGF) gene family (e.g., FGF1; 131220) are peptide regula-

tory factors acting through 4 distinct tyrosine kinase receptors and involved in various biologic processes during embryogenesis and adult life, including implantation, morphogenesis, angiogenesis, and possibly tumorigenesis. Miyamoto et al. (1993) cloned the ninth member of the FGF family. By radioactive chromosomal in situ hybridization, Mattei et al. (1995) mapped the gene to 13q11-q12. Using the Cre/loxP system, Sun et al. (2000) found that maintenance of Fgf9 and Fgf17 (OMIM Ref. No. 603725) expression is dependent on Shh (OMIM Ref. No. 600725), whereas Fgf8 (OMIM Ref. No. 600483) expression is not. Sun et al. (2000) developed a model in which no individual Fgf expressed in the apical ectodermal ridge is solely necessary to maintain Shh expression, but instead the combined activity of 2 or more apical ectodermal ridge Fgfs function in a positive feedback loop with Shh to control limb development. Colvin et al. (2001) reported male-to-female sex reversal in mice lacking Fgf9, demonstrating a novel role for FGF signaling in testicular embryogenesis. Fgf9  $-/-$  mice also exhibited lung hypoplasia and died at birth. Reproductive system phenotypes ranged from testicular hypoplasia to complete sex reversal, with most Fgf9  $-/-$  XY reproductive systems ap-

pearing grossly female at birth. Fgf9 appeared to act downstream of Sry (OMIM Ref. No. 480000) to stimulate mesenchymal proliferation, mesonephric cell migration, and Sertoli cell differentiation in the embryonic testis.

While Sry is found only in some mammals, Fgfs are highly conserved. Thus, Fgfs may function in sex determination and reproductive system development in many species.

[33011] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33012] Colvin, J. S.; Green, R. P.; Schmahl, J.; Capel, B.; Ornitz, D. M. : Male-to-female sex reversal in mice lacking fibroblast growth factor 9. Cell 104: 875–889, 2001. ; and

[33013] Sun, X.; Lewandoski, M.; Meyers, E. N.; Liu, Y.-H.; Maxson, R. E., Jr.; Martin, G. R. : Conditional inactivation of Fgf4 reveals complexity of signalling during limb bud development. Na.

[33014] Further studies establishing the function and utilities of FGF9 are found in John Hopkins OMIM database record ID 600921, and in cited publications numbered 9955–995 and 3289 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Ac-

cession NM\_002053) is another VGAM864 host target gene. GBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBP1 BINDING SITE, designated SEQ ID:7809, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33015] Another function of VGAM864 is therefore inhibition of Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Accession NM\_002053), a gene which specifically binds guanylate nucleotides (GMP, GDP and GTP). Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBP1. The function of GBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46. GEMIN5 (Accession XM\_114471) is another VGAM864 host target gene. GEMIN5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GEMIN5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GEMIN5 BINDING SITE, designated SEQ ID:42974, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33016] Another function of VGAM864 is therefore inhibition of GEMIN5 (Accession XM\_114471). Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GEMIN5. DKFZp434D177 (Accession NM\_032264) is another VGAM864 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26009, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33017] Another function of VGAM864 is therefore inhibition of DKFZp434D177 (Accession NM\_032264). Accordingly, utilities of VGAM864 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp434D177. LOC123745 (Accession XM\_063826) is another VGAM864 host target gene. LOC123745 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123745 BINDING SITE, designated SEQ ID:37255, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33018] Another function of VGAM864 is therefore inhibition of LOC123745 (Accession XM\_063826). Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123745. LOC149010 (Accession XM\_086397) is another VGAM864 host target gene. LOC149010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149010 BINDING SITE, designated SEQ ID:38629, to

the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33019] Another function of VGAM864 is therefore inhibition of LOC149010 (Accession XM\_086397). Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149010. LOC162333 (Accession XM\_102591) is another VGAM864 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42143, to the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, also designated SEQ ID:3575.

[33020] Another function of VGAM864 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 865 (VGAM865) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33021] VGAM865 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM865 was detected is described hereinabove with reference to Figs. 1–8.

[33022] VGAM865 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus. VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33023] VGAM865 gene encodes a VGAM865 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM865 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM865 precursor RNA is designated SEQ ID:851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:851 is located at position 38140 relative to the genome of Swinepox Virus.

[33024] VGAM865 precursor RNA folds onto itself, forming VGAM865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33025] An enzyme complex designated DICER COMPLEX, `dices` the VGAM865 folded precursor RNA into VGAM865 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM865 RNA is designated SEQ ID:3576, and is provided hereinbelow with reference to the sequence listing part.

[33026] VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM865 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM865 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33027] VGAM865 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM865 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM865 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33028] The complementary binding of VGAM865 RNA, herein designated VGAM RNA, to host target binding sites on VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM865 host target RNA into VGAM865 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33029] It is appreciated that VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM865 host target genes. The mRNA of each one of this plurality of VGAM865 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM865 RNA, herein designated VGAM RNA, and which when bound by VGAM865 RNA causes inhibition of translation of respective one or more VGAM865 host target proteins.

[33030] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM865 gene, herein designated VGAM GENE, on one or more VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33031] It is yet further appreciated that a function of VGAM865 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific functions, and accordingly utilities, of VGAM865 correlate with, and may be deduced from, the identity of the host

target genes which VGAM865 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33032] Nucleotide sequences of the VGAM865 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM865 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM865 are further described hereinbelow with reference to Table 1.
- [33033] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM865 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM865 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33034] As mentioned hereinabove with reference to Fig. 1, a function of VGAM865 gene, herein designated VGAM is inhibition of expression of VGAM865 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM865 correlate with, and may be deduced from, the identity of the target genes which VGAM865

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33035] LNK (Accession NM\_005475) is a VGAM865 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11968, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33036] A function of VGAM865 is therefore inhibition of LNK (Accession NM\_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115. Reticulocalbin 1, EF-hand Calcium Binding Domain (RCN1, Accession NM\_002901) is another VGAM865 host target gene. RCN1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCN1 BINDING SITE, designated SEQ ID:8803, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33037] Another function of VGAM865 is therefore inhibition of Reticulocalbin 1, EF-hand Calcium Binding Domain (RCN1, Accession NM\_002901), a gene which may regulate calcium-dependent activities in the ER lumen or post-ER compartment. Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCN1. The function of RCN1 has been established by previous studies. The endoplasmic reticulum (ER) is the major storage compartment for calcium in most eukaryotic cells. Ozawa and Muramatsu (1993) identified cDNAs encoding mouse reticulocalbin (Rcn), a calcium-binding protein located in the lumen of the ER. By PCR using oligonucleotides based on the nucleotide sequence of mouse Rcn, Ozawa (1995) isolated cDNAs encoding RCN1 from human transitional car-

cinoma cell line cDNAs. The predicted 331-amino acid human RCN1 protein is 95% identical to the mouse Rcn protein. RCN1 contains a leader peptide, 6 EF-hand calcium-binding motifs, and a C-terminal HDEL sequence, which serves as an ER retention signal. By Western blot analysis of human mammalian cell extracts, antibodies against Rcn recognized 44- and 46-kD proteins. Northern blot analysis revealed that RCN1 was expressed as a 2.4-kb transcript in all tissues tested. Kent et al. (1997) identified the human RCN1 gene within a cosmid contig of 11p13 and localized it between the WT1 (OMIM Ref. No. 607102) and PAX6 (OMIM Ref. No. 607108) genes. By interspecific backcross analysis, Kent et al. (1997) mapped the mouse Rcn gene to chromosome 2, in a region showing homology of synteny with human 11p14-p13.

[33038] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33039] Ozawa, M. : Cloning of a human homologue of mouse reticulocalbin reveals conservation of structural domains in the novel endoplasmic reticulum resident  $\text{Ca}^{2+}$ -binding protein with multiple EF-hand motifs. J. Biochem. 117: 1113-1119, 1995. ; and

[33040] Kent, J.; Lee, M.; Schedl, A.; Boyle, S.; Fantes, J.; Powell, M.; Rushmere, N.; Abbott, C.; van Heyningen, V.; Bickmore, W. A. : The reticulocalbin gene maps to the WAGR region in human.

[33041] Further studies establishing the function and utilities of RCN1 are found in John Hopkins OMIM database record ID 602735, and in cited publications numbered 8765–8767 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ22795 (Accession NM\_025084) is another VGAM865 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24688, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33042] Another function of VGAM865 is therefore inhibition of FLJ22795 (Accession NM\_025084). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795.

TNF Receptor-associated Factor 6 (TRAF6, Accession NM\_004620) is another VGAM865 host target gene. TRAF6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRAF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF6 BINDING SITE, designated SEQ ID:10969, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33043] Another function of VGAM865 is therefore inhibition of TNF Receptor-associated Factor 6 (TRAF6, Accession NM\_004620). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF6. LOC121599 (Accession XM\_058576) is another VGAM865 host target gene. LOC121599 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121599 BINDING SITE, desig-

nated SEQ ID:36672, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33044] Another function of VGAM865 is therefore inhibition of LOC121599 (Accession XM\_058576). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121599. LOC145717 (Accession XM\_039771) is another VGAM865 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33189, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33045] Another function of VGAM865 is therefore inhibition of LOC145717 (Accession XM\_039771). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC220537 (Accession XM\_165406) is another VGAM865 host target gene. LOC220537 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43621, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33046] Another function of VGAM865 is therefore inhibition of LOC220537 (Accession XM\_165406). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC51580 (Accession NM\_015874) is another VGAM865 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18010, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33047] Another function of VGAM865 is therefore inhibition of

LOC51580 (Accession NM\_015874). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC54103 (Accession XM\_168508) is another VGAM865 host target gene. LOC54103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54103 BINDING SITE, designated SEQ ID:45209, to the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, also designated SEQ ID:3576.

[33048] Another function of VGAM865 is therefore inhibition of LOC54103 (Accession XM\_168508). Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 866 (VGAM866) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[33049] VGAM866 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM866 was detected is described hereinabove with reference to Figs. 1–8.

[33050] VGAM866 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus. VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33051] VGAM866 gene encodes a VGAM866 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM866 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM866 precursor RNA is designated SEQ ID:852, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:852 is located at position 37456 relative to the genome of Swinepox Virus.

[33052] VGAM866 precursor RNA folds onto itself, forming VGAM866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[33053] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM866 folded precursor RNA into VGAM866 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM866 RNA is designated SEQ ID:3577, and  
is provided hereinbelow with reference to the sequence  
listing part.

[33054] VGAM866 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM866 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM866 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33055] VGAM866 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM866 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM866 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[33056] The complementary binding of VGAM866 RNA, herein designated VGAM RNA, to host target binding sites on VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM866 host target RNA into VGAM866 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33057] It is appreciated that VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM866 host target genes. The mRNA of each one of this plurality of VGAM866 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM866 RNA, herein designated VGAM RNA, and which when bound by VGAM866 RNA causes inhibition of translation of respective one or more VGAM866 host target proteins.

[33058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM866 gene, herein designated VGAM GENE, on one or

more VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33059] It is yet further appreciated that a function of VGAM866 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM866 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific functions, and accordingly utilities, of VGAM866 correlate with, and may be deduced from, the identity of the host target genes which VGAM866 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33060] Nucleotide sequences of the VGAM866 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM866 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM866 are further described hereinbelow with reference to Table 1.
- [33061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM866 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM866 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33062] As mentioned hereinabove with reference to Fig. 1, a function of VGAM866 gene, herein designated VGAM is inhibition of expression of VGAM866 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM866 correlate with, and may be deduced from, the identity of the target genes which VGAM866 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [33063] Kinesin Family Member 5C (KIF5C, Accession NM\_004522)

is a VGAM866 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10856, to the nucleotide sequence of VGAM866 RNA, herein designated VGAM RNA, also designated SEQ ID:3577.

[33064] A function of VGAM866 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 867 (VGAM867) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33065] VGAM867 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM867 was detected is described

hereinabove with reference to Figs. 1–8.

[33066] VGAM867 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3.

VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33067] VGAM867 gene encodes a VGAM867 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM867 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM867 precursor RNA is designated SEQ ID:853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:853 is located at position 5962 relative to the genome of Turkey Adenovirus 3.

[33068] VGAM867 precursor RNA folds onto itself, forming VGAM867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33069] An enzyme complex designated DICER COMPLEX, `dices` the VGAM867 folded precursor RNA into VGAM867 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM867 RNA is designated SEQ ID:3578, and is provided hereinbelow with reference to the sequence listing part.

[33070] VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM867 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33071] VGAM867 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM867 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM867 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33072] The complementary binding of VGAM867 RNA, herein designated VGAM RNA, to host target binding sites on VGAM867 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM867 host target RNA into VGAM867 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33073] It is appreciated that VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM867 host target genes. The mRNA of each one of this plurality of VGAM867 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM867 RNA, herein designated VGAM RNA, and which when bound by VGAM867 RNA causes inhibition of translation of respective one or more VGAM867 host target proteins.

[33074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM867 gene, herein designated VGAM GENE, on one or more VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33075] It is yet further appreciated that a function of VGAM867 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM867 include diagnosis, prevention and treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM867 correlate with, and may be deduced from, the identity of the host target genes which VGAM867 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33076] Nucleotide sequences of the VGAM867 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM867 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM867 are further described hereinbelow with reference to Table 1.

[33077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM867 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM867 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33078] As mentioned hereinabove with reference to Fig. 1, a function of VGAM867 gene, herein designated VGAM is inhibition of expression of VGAM867 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM867 correlate with, and may be deduced from, the identity of the target genes which VGAM867 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33079] CAP350 (Accession NM\_014810) is a VGAM867 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:16768, to the nucleotide sequence of VGAM867 RNA, herein designated VGAM RNA, also designated SEQ ID:3578.

[33080] A function of VGAM867 is therefore inhibition of CAP350 (Accession NM\_014810). Accordingly, utilities of VGAM867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. LOC219942 (Accession XM\_167790) is another VGAM867 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:44827, to the nucleotide sequence of VGAM867 RNA, herein designated VGAM RNA, also designated SEQ ID:3578.

[33081] Another function of VGAM867 is therefore inhibition of LOC219942 (Accession XM\_167790). Accordingly, utilities of VGAM867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219942. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 868 (VGAM868) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33082] VGAM868 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM868 was detected is described hereinabove with reference to Figs. 1–8.

[33083] VGAM868 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3. VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33084] VGAM868 gene encodes a VGAM868 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM868 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM868 precursor RNA is designated SEQ ID:854, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:854 is located at position 5577 relative to the genome of Turkey Adenovirus 3.

[33085] VGAM868 precursor RNA folds onto itself, forming VGAM868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33086] An enzyme complex designated DICER COMPLEX, `dices` the VGAM868 folded precursor RNA into VGAM868 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM868 RNA is designated SEQ ID:3579, and is provided hereinbelow with reference to the sequence listing part.

[33087] VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM868 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33088] VGAM868 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM868 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM868 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[33089] The complementary binding of VGAM868 RNA, herein designated VGAM RNA, to host target binding sites on VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM868 host target RNA into VGAM868 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33090] It is appreciated that VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM868 host target genes. The mRNA of each one of this plurality of VGAM868 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM868 RNA, herein designated VGAM RNA, and which when bound by VGAM868 RNA causes in-

hibition of translation of respective one or more VGAM868 host target proteins.

[33091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM868 gene, herein designated VGAM GENE, on one or more VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33092] It is yet further appreciated that a function of VGAM868 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM868 include diagnosis, prevention and

treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM868 correlate with, and may be deduced from, the identity of the host target genes which VGAM868 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33093] Nucleotide sequences of the VGAM868 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM868 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM868 are further described hereinbelow with reference to Table 1.
- [33094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM868 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM868 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33095] As mentioned hereinabove with reference to Fig. 1, a function of VGAM868 gene, herein designated VGAM is inhibition of expression of VGAM868 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM868 correlate with, and may be deduced from, the identity of the target genes which VGAM868 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33096] Matrilin 3 (MATN3, Accession NM\_002381) is a VGAM868 host target gene. MATN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MATN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATN3 BINDING SITE, designated SEQ ID:8197, to the nucleotide sequence of VGAM868 RNA, herein designated VGAM RNA, also designated SEQ ID:3579.

[33097] A function of VGAM868 is therefore inhibition of Matrilin 3 (MATN3, Accession NM\_002381). Accordingly, utilities of VGAM868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATN3. AAK1 (Accession NM\_014911) is another VGAM868 host target gene. AAK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AAK1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:17144, to the nucleotide sequence of VGAM868 RNA, herein designated VGAM RNA, also designated SEQ ID:3579.

[33098] Another function of VGAM868 is therefore inhibition of AAK1 (Accession NM\_014911). Accordingly, utilities of VGAM868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1. DKFZP434A043 (Accession NM\_015396) is another VGAM868 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434A043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17703, to the nucleotide sequence of VGAM868 RNA, herein designated VGAM RNA, also designated SEQ ID:3579.

[33099] Another function of VGAM868 is therefore inhibition of DKFZP434A043 (Accession NM\_015396). Accordingly, utilities of VGAM868 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434A043. LOC221074 (Accession XM\_167663) is another VGAM868 host target gene. LOC221074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221074 BINDING SITE, designated SEQ ID:44748, to the nucleotide sequence of VGAM868 RNA, herein designated VGAM RNA, also designated SEQ ID:3579.

[33100] Another function of VGAM868 is therefore inhibition of LOC221074 (Accession XM\_167663). Accordingly, utilities of VGAM868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221074. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 869 (VGAM869) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33101] VGAM869 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM869 was detected is described hereinabove with reference to Figs. 1–8.

[33102] VGAM869 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33103] VGAM869 gene encodes a VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM869 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM869 precursor RNA is designated SEQ ID:855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:855 is located at position 174898 relative to the genome of Fowlpox Virus.

[33104] VGAM869 precursor RNA folds onto itself, forming VGAM869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33105] An enzyme complex designated DICER COMPLEX, `dices` the VGAM869 folded precursor RNA into VGAM869 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM869 RNA is designated SEQ ID:3580, and is provided hereinbelow with reference to the sequence listing part.

[33106] VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM869 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33107] VGAM869 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM869 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM869 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33108] The complementary binding of VGAM869 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM869 host target RNA into VGAM869 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33109] It is appreciated that VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM869 host target genes. The mRNA of each one of this plurality of VGAM869 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM869 RNA, herein designated VGAM RNA, and which when bound by VGAM869 RNA causes inhibition of translation of respective one or more VGAM869 host target proteins.

[33110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM869 gene, herein designated VGAM GENE, on one or more VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33111] It is yet further appreciated that a function of VGAM869 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM869 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM869 correlate with, and may be deduced from, the identity of the host target genes which VGAM869 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33112] Nucleotide sequences of the VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM869 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM869 are further described hereinbelow with reference to Table 1.

[33113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM869 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM869 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33114] As mentioned hereinabove with reference to Fig. 1, a function of VGAM869 gene, herein designated VGAM is inhibition of expression of VGAM869 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM869 correlate with, and may be deduced from, the identity of the target genes which VGAM869 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33115] MLL Septin-like Fusion (MSF, Accession XM\_113892) is a VGAM869 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42518, to the nucleotide sequence of VGAM869 RNA, herein designated VGAM RNA, also designated SEQ ID:3580.

[33116] A function of VGAM869 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM\_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514. Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069) is another VGAM869 host target gene. SIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM2 BINDING SITE, designated SEQ ID:11515,

to the nucleotide sequence of VGAM869 RNA, herein designated VGAM RNA, also designated SEQ ID:3580.

[33117] Another function of VGAM869 is therefore inhibition of Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069), a gene which may be a master gene of CNS development. Accordingly, utilities of VGAM869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 870 (VGAM870) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33118] VGAM870 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM870 was detected is described hereinabove with reference to Figs. 1–8.

[33119] VGAM870 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33120] VGAM870 gene encodes a VGAM870 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM870 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM870 precursor RNA is designated SEQ ID:856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:856 is located at position 175174 relative to the genome of Fowlpox Virus.

[33121] VGAM870 precursor RNA folds onto itself, forming VGAM870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33122] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM870 folded precursor RNA into VGAM870 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM870 RNA is designated SEQ ID:3581, and is provided hereinbelow with reference to the sequence listing part.

[33123] VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM870 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33124] VGAM870 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM870 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM870 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33125] The complementary binding of VGAM870 RNA, herein designated VGAM RNA, to host target binding sites on VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM870 host target RNA into VGAM870 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33126] It is appreciated that VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM870 host target genes. The mRNA of each one of this plurality of VGAM870 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM870 RNA, herein designated VGAM RNA, and which when bound by VGAM870 RNA causes inhibition of translation of respective one or more VGAM870 host target proteins.

[33127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM870 gene, herein designated VGAM GENE, on one or more VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33128] It is yet further appreciated that a function of VGAM870 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM870 correlate with, and may be deduced from, the identity of the host target genes which VGAM870 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33129] Nucleotide sequences of the VGAM870 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM870 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM870 are further described hereinbelow with reference to Table 1.

- [33130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM870 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM870 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33131] As mentioned hereinabove with reference to Fig. 1, a function of VGAM870 gene, herein designated VGAM is inhibition of expression of VGAM870 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM870 correlate with, and may be deduced from, the identity of the target genes which VGAM870 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [33132] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is a VGAM870 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ

ID:15421, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33133] A function of VGAM870 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464) is another VGAM870 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10777 and SEQ ID:27004 respectively, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33134] Another function of VGAM870 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM870 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM\_034274) is another VGAM870 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:32042, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33135] Another function of VGAM870 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM\_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with MYBL1. The function of MYBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM184. Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652) is another VGAM870 host target gene. CRNKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRNKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRNKL1 BINDING SITE, designated SEQ ID:18772, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33136] Another function of VGAM870 is therefore inhibition of Crn, Crooked Neck-like 1 (Drosophila) (CRNKL1, Accession NM\_016652). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRNKL1. FLJ11142 (Accession NM\_018338) is another VGAM870 host target gene. FLJ11142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11142, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11142 BINDING SITE, designated SEQ ID:20344, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33137] Another function of VGAM870 is therefore inhibition of FLJ11142 (Accession NM\_018338). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11142. FLJ12770 (Accession NM\_032174) is another VGAM870 host target gene. FLJ12770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12770 BINDING SITE, designated SEQ ID:25883, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33138] Another function of VGAM870 is therefore inhibition of FLJ12770 (Accession NM\_032174). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ12770. KIAA0275 (Accession NM\_014767) is another VGAM870 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE, designated SEQ ID:16552, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33139] Another function of VGAM870 is therefore inhibition of KIAA0275 (Accession NM\_014767). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0275. NIR3 (Accession XM\_038799) is another VGAM870 host target gene. NIR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32924, to the nucleotide sequence of

VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33140] Another function of VGAM870 is therefore inhibition of NIR3 (Accession XM\_038799). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. PRMT6 (Accession NM\_018137) is another VGAM870 host target gene. PRMT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRMT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRMT6 BINDING SITE, designated SEQ ID:19933, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33141] Another function of VGAM870 is therefore inhibition of PRMT6 (Accession NM\_018137). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRMT6. Syntaxin 6 (STX6, Accession NM\_005819) is another VGAM870 host target gene. STX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by STX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX6 BINDING SITE, designated SEQ ID:12420, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33142] Another function of VGAM870 is therefore inhibition of Syntaxin 6 (STX6, Accession NM\_005819). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX6. LOC146059 (Accession XM\_085300) is another VGAM870 host target gene. LOC146059 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146059 BINDING SITE, designated SEQ ID:38052, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33143] Another function of VGAM870 is therefore inhibition of LOC146059 (Accession XM\_085300). Accordingly, utilities

of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146059. LOC51107 (Accession NM\_016022) is another VGAM870 host target gene. LOC51107 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51107 BINDING SITE, designated SEQ ID:18097, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33144] Another function of VGAM870 is therefore inhibition of LOC51107 (Accession NM\_016022). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51107. LOC91408 (Accession XM\_038290) is another VGAM870 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91408 BINDING SITE, designated SEQ ID:32789, to the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, also designated SEQ ID:3581.

[33145] Another function of VGAM870 is therefore inhibition of LOC91408 (Accession XM\_038290). Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 871 (VGAM871) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33146] VGAM871 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM871 was detected is described hereinabove with reference to Figs. 1–8.

[33147] VGAM871 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33148] VGAM871 gene encodes a VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM871 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM871 precursor RNA is designated SEQ ID:857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:857 is located at position 172281 relative to the genome of Fowlpox Virus.

[33149] VGAM871 precursor RNA folds onto itself, forming VGAM871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33150] An enzyme complex designated DICER COMPLEX, `dices` the VGAM871 folded precursor RNA into VGAM871 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM871 RNA is designated SEQ ID:3582, and is provided hereinbelow with reference to the sequence listing part.

[33151] VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM871 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33152] VGAM871 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM871 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM871 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33153] The complementary binding of VGAM871 RNA, herein designated VGAM RNA, to host target binding sites on VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM871 host target RNA into VGAM871 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33154] It is appreciated that VGAM871 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM871 host target genes. The mRNA of each one of this plurality of VGAM871 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM871 RNA, herein designated VGAM RNA, and which when bound by VGAM871 RNA causes inhibition of translation of respective one or more VGAM871 host target proteins.

[33155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM871 gene, herein designated VGAM GENE, on one or more VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[33156] It is yet further appreciated that a function of VGAM871 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM871 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM871 correlate with, and may be deduced from, the identity of the host target genes which VGAM871 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33157] Nucleotide sequences of the VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM871 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM871 are further described hereinbelow with reference to Table 1.

[33158] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM871 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM871 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33159] As mentioned hereinabove with reference to Fig. 1, a function of VGAM871 gene, herein designated VGAM is inhibition of expression of VGAM871 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM871 correlate with, and may be deduced from, the identity of the target genes which VGAM871 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33160] KIAA0677 (Accession NM\_014663) is a VGAM871 host target gene. KIAA0677 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0677 BINDING SITE, designated SEQ ID:16111, to the nucleotide sequence of VGAM871 RNA, herein designated VGAM RNA, also designated SEQ ID:3582.

[33161] A function of VGAM871 is therefore inhibition of

KIAA0677 (Accession NM\_014663). Accordingly, utilities of VGAM871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0677. LOC90777 (Accession XM\_034052) is another VGAM871 host target gene. LOC90777 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90777 BINDING SITE, designated SEQ ID:31994, to the nucleotide sequence of VGAM871 RNA, herein designated VGAM RNA, also designated SEQ ID:3582.

[33162] Another function of VGAM871 is therefore inhibition of LOC90777 (Accession XM\_034052). Accordingly, utilities of VGAM871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90777. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 872 (VGAM872) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[33163] VGAM872 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM872 was detected is described hereinabove with reference to Figs. 1–8.

[33164] VGAM872 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33165] VGAM872 gene encodes a VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM872 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM872 precursor RNA is designated SEQ ID:858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:858 is located at position 172697 relative to the genome of Fowlpox Virus.

[33166] VGAM872 precursor RNA folds onto itself, forming VGAM872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[33167] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM872 folded precursor RNA into VGAM872 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 72%) nucleotide se-  
quence of VGAM872 RNA is designated SEQ ID:3583, and  
is provided hereinbelow with reference to the sequence  
listing part.

[33168] VGAM872 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM872 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM872 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33169] VGAM872 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM872 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM872 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[33170] The complementary binding of VGAM872 RNA, herein designated VGAM RNA, to host target binding sites on VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM872 host target RNA into VGAM872 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33171] It is appreciated that VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM872 host target genes. The mRNA of each one of this plurality of VGAM872 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM872 RNA, herein designated VGAM RNA, and which when bound by VGAM872 RNA causes inhibition of translation of respective one or more VGAM872 host target proteins.

[33172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM872 gene, herein designated VGAM GENE, on one or

more VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33173] It is yet further appreciated that a function of VGAM872 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM872 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM872 correlate with, and may be deduced from, the identity of the host target genes which VGAM872 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33174] Nucleotide sequences of the VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM872 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM872 are further described hereinbelow with reference to Table 1.
- [33175] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM872 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM872 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33176] As mentioned hereinabove with reference to Fig. 1, a function of VGAM872 gene, herein designated VGAM is inhibition of expression of VGAM872 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM872 correlate with, and may be deduced from, the identity of the target genes which VGAM872 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [33177] Integral Membrane Protein 2B (ITM2B, Accession

NM\_021999) is a VGAM872 host target gene. ITM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITM2B BINDING SITE, designated SEQ ID:22537, to the nucleotide sequence of VGAM872 RNA, herein designated VGAM RNA, also designated SEQ ID:3583.

[33178] A function of VGAM872 is therefore inhibition of Integral Membrane Protein 2B (ITM2B, Accession NM\_021999), a gene which is a member of the type II integral membrane protein family. Accordingly, utilities of VGAM872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM2B. The function of ITM2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM458.DKFZP434G1411 (Accession XM\_166383) is another VGAM872 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44228, to the nucleotide sequence of VGAM872 RNA, herein designated VGAM RNA, also designated SEQ ID:3583.

[33179] Another function of VGAM872 is therefore inhibition of DKFZP434G1411 (Accession XM\_166383). Accordingly, utilities of VGAM872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. LOC151103 (Accession XM\_098004) is another VGAM872 host target gene. LOC151103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151103 BINDING SITE, designated SEQ ID:41298, to the nucleotide sequence of VGAM872 RNA, herein designated VGAM RNA, also designated SEQ ID:3583.

[33180] Another function of VGAM872 is therefore inhibition of LOC151103 (Accession XM\_098004). Accordingly, utilities

of VGAM872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 873 (VGAM873) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33181] VGAM873 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM873 was detected is described hereinabove with reference to Figs. 1–8.

[33182] VGAM873 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33183] VGAM873 gene encodes a VGAM873 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM873 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM873 precursor RNA is designated SEQ ID:859, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:859 is located at position 174514 relative to the genome of Fowlpox Virus.

[33184] VGAM873 precursor RNA folds onto itself, forming VGAM873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33185] An enzyme complex designated DICER COMPLEX, `dices` the VGAM873 folded precursor RNA into VGAM873 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM873 RNA is designated SEQ ID:3584, and

is provided hereinbelow with reference to the sequence listing part.

[33186] VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM873 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33187] VGAM873 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM873 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM873 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33188] The complementary binding of VGAM873 RNA, herein designated VGAM RNA, to host target binding sites on VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM873 host target RNA into VGAM873 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33189] It is appreciated that VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM873 host target genes. The mRNA of each one of this plurality of VGAM873 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM873 RNA, herein designated VGAM RNA, and which when bound by VGAM873 RNA causes inhibition of translation of respective one or more VGAM873 host target proteins.

[33190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM873 gene, herein designated VGAM GENE, on one or more VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33191] It is yet further appreciated that a function of VGAM873 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM873 correlate with, and may be deduced from, the identity of the host target genes which VGAM873 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33192] Nucleotide sequences of the VGAM873 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM873 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM873 are further described hereinbelow with reference to Table 1.

[33193] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM873 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM873 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33194] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM873 gene, herein designated VGAM is inhibition of expression of VGAM873 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM873 correlate with, and may be deduced from, the identity of the target genes which VGAM873 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33195] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380) is a VGAM873 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13081, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33196] A function of VGAM873 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM873 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525. Cannabinoid Receptor 1 (brain) (CNR1, Accession NM\_016083) is another VGAM873 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18166, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33197] Another function of VGAM873 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM\_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM533. Chromosome X Open Reading Frame 6 (CXorf6, Accession NM\_005491) is another VGAM873 host target gene. CXorf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE, designated SEQ ID:11990, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33198] Another function of VGAM873 is therefore inhibition of Chromosome X Open Reading Frame 6 (CXorf6, Accession NM\_005491). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf6. Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM\_002225) is another VGAM873 host target gene. IVD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IVD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of IVD BINDING SITE, designated SEQ ID:8002, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33199] Another function of VGAM873 is therefore inhibition of Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM\_002225). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IVD. Membrane-spanning 4-domains, Subfamily A, Member 3 (hematopoietic cell-specific) (MS4A3, Accession NM\_006138) is another VGAM873 host target gene. MS4A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A3 BINDING SITE, designated SEQ ID:12778, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33200] Another function of VGAM873 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 3 (hematopoietic cell-specific) (MS4A3, Accession

NM\_006138). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A3. Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768) is another VGAM873 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYEOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:29000, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33201] Another function of VGAM873 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768), a gene which is encoded by MYELOMA OVEREXPRESSED GENE. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM471. Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709) is another VGAM873 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8554, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33202] Another function of VGAM873 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46. TEA Domain Family Member 3 (TEAD3, Accession NM\_003214) is another VGAM873 host

target gene. TEAD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEAD3 BINDING SITE, designated SEQ ID:9212, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33203] Another function of VGAM873 is therefore inhibition of TEA Domain Family Member 3 (TEAD3, Accession NM\_003214), a gene which binds to multiple functional elements of the human chorionic somatomammotropin- $\beta$  gene enhancer. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEAD3. The function of TEAD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299. Ubiquitin Specific Protease 6 (Ure-2 oncogene) (USP6, Accession XM\_165948) is another VGAM873 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43812, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33204] Another function of VGAM873 is therefore inhibition of Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM\_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM296. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695) is another VGAM873 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35479, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33205] Another function of VGAM873 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM873 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18374, to the nucleotide se-

quence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33206] Another function of VGAM873 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. DJ667H12.2 (Accession NM\_019605) is another VGAM873 host target gene. DJ667H12.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ667H12.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ667H12.2 BINDING SITE, designated SEQ ID:21216, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33207] Another function of VGAM873 is therefore inhibition of DJ667H12.2 (Accession NM\_019605). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ667H12.2. FLJ00001 (Accession XM\_088525) is another VGAM873 host target gene. FLJ00001 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39778, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33208] Another function of VGAM873 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ14007 (Accession NM\_024699) is another VGAM873 host target gene. FLJ14007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14007 BINDING SITE, designated SEQ ID:24009, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33209] Another function of VGAM873 is therefore inhibition of

FLJ14007 (Accession NM\_024699). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14007. FLJ23017 (Accession NM\_022840) is another VGAM873 host target gene. FLJ23017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23017 BINDING SITE, designated SEQ ID:23132, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33210] Another function of VGAM873 is therefore inhibition of FLJ23017 (Accession NM\_022840). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23017. KIAA0229 (Accession XM\_166478) is another VGAM873 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44404, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33211] Another function of VGAM873 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA0285 (Accession NM\_014807) is another VGAM873 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16754, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33212] Another function of VGAM873 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0513 (Accession NM\_014732) is another

VGAM873 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16362, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33213] Another function of VGAM873 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA1041 (Accession NM\_014947) is another VGAM873 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17263, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33214] Another function of VGAM873 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1171 (Accession XM\_113868) is another VGAM873 host target gene. KIAA1171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1171 BINDING SITE, designated SEQ ID:42481, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33215] Another function of VGAM873 is therefore inhibition of KIAA1171 (Accession XM\_113868). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1171. KIAA1348 (Accession XM\_043826) is another VGAM873 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34027, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33216] Another function of VGAM873 is therefore inhibition of KIAA1348 (Accession XM\_043826). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348. PLU-1 (Accession NM\_006618) is another VGAM873 host target gene. PLU-1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLU-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLU-1 BINDING SITE, designated SEQ ID:13403, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33217] Another function of VGAM873 is therefore inhibition of PLU-1 (Accession NM\_006618). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLU-1.

SET Binding Protein 1 (SETBP1, Accession NM\_015559) is another VGAM873 host target gene. SETBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SETBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SETBP1 BINDING SITE, designated SEQ ID:17828, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33218] Another function of VGAM873 is therefore inhibition of SET Binding Protein 1 (SETBP1, Accession NM\_015559). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SETBP1. Transcription Factor 6-like 1 (mitochondrial transcription factor 1-like) (TCF6L1, Accession NM\_003201) is another VGAM873 host target gene. TCF6L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF6L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF6L1 BINDING SITE, designated SEQ

ID:9188, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33219] Another function of VGAM873 is therefore inhibition of Transcription Factor 6-like 1 (mitochondrial transcription factor 1-like) (TCF6L1, Accession NM\_003201). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF6L1. Ubiquitin-conjugating Enzyme E2D 3 (UBC4/5 homolog, yeast) (UBE2D3, Accession NM\_003340) is another VGAM873 host target gene. UBE2D3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2D3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2D3 BINDING SITE, designated SEQ ID:9346, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33220] Another function of VGAM873 is therefore inhibition of Ubiquitin-conjugating Enzyme E2D 3 (UBC4/5 homolog, yeast) (UBE2D3, Accession NM\_003340). Accordingly, util-

ities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2D3. LOC153778 (Accession XM\_087762) is another VGAM873 host target gene. LOC153778 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153778 BINDING SITE, designated SEQ ID:39408, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33221] Another function of VGAM873 is therefore inhibition of LOC153778 (Accession XM\_087762). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153778. LOC196955 (Accession XM\_085210) is another VGAM873 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196955 BINDING SITE, designated SEQ ID:37934, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33222] Another function of VGAM873 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC199858 (Accession XM\_114040) is another VGAM873 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42637, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33223] Another function of VGAM873 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC199870 (Accession XM\_114043) is another VGAM873 host target gene. LOC199870 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199870 BINDING SITE, designated SEQ ID:42647, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33224] Another function of VGAM873 is therefore inhibition of LOC199870 (Accession XM\_114043). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199870. LOC200488 (Accession XM\_117240) is another VGAM873 host target gene. LOC200488 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200488 BINDING SITE, designated SEQ ID:43315, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33225] Another function of VGAM873 is therefore inhibition of

LOC200488 (Accession XM\_117240). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200488. LOC200942 (Accession XM\_114323) is another VGAM873 host target gene. LOC200942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200942 BINDING SITE, designated SEQ ID:42872, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33226] Another function of VGAM873 is therefore inhibition of LOC200942 (Accession XM\_114323). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200942. LOC202181 (Accession XM\_114456) is another VGAM873 host target gene. LOC202181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC202181 BINDING SITE, designated SEQ ID:42968, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33227] Another function of VGAM873 is therefore inhibition of LOC202181 (Accession XM\_114456). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202181. LOC93259 (Accession XM\_050105) is another VGAM873 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35563, to the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, also designated SEQ ID:3584.

[33228] Another function of VGAM873 is therefore inhibition of LOC93259 (Accession XM\_050105). Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 874 (VGAM874) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33229] VGAM874 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM874 was detected is described hereinabove with reference to Figs. 1–8.

[33230] VGAM874 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus. VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33231] VGAM874 gene encodes a VGAM874 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM874 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM874 precursor RNA is designated SEQ ID:860, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:860 is

located at position 91946 relative to the genome of Swinepox Virus.

[33232] VGAM874 precursor RNA folds onto itself, forming VGAM874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33233] An enzyme complex designated DICER COMPLEX, `dices` the VGAM874 folded precursor RNA into VGAM874 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM874 RNA is designated SEQ ID:3585, and is provided hereinbelow with reference to the sequence listing part.

[33234] VGAM874 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM874 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33235] VGAM874 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM874 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM874 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM874 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33236] The complementary binding of VGAM874 RNA, herein designated VGAM RNA, to host target binding sites on VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM874 host target RNA into VGAM874 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33237] It is appreciated that VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM874 host target genes. The mRNA of each one of this plurality of VGAM874 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM874 RNA, herein designated VGAM RNA, and which when bound by VGAM874 RNA causes inhibition of translation of respective one or more VGAM874

host target proteins.

[33238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM874 gene, herein designated VGAM GENE, on one or more VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33239] It is yet further appreciated that a function of VGAM874 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific

functions, and accordingly utilities, of VGAM874 correlate with, and may be deduced from, the identity of the host target genes which VGAM874 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33240] Nucleotide sequences of the VGAM874 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM874 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM874 are further described hereinbelow with reference to Table 1.

[33241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM874 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM874 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM874 gene, herein designated VGAM is inhibition of expression of VGAM874 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM874 correlate with, and may be deduced from, the identity of the target genes which VGAM874 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33243] Gamma-aminobutyric Acid (GABA) A Receptor, Alpha 5 (GABRA5, Accession XM\_012441) is a VGAM874 host target gene. GABRA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABRA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRA5 BINDING SITE, designated SEQ ID:30213, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33244] A function of VGAM874 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Alpha 5 (GABRA5, Accession XM\_012441), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRA5. The function of GABRA5 has been estab-

lished by previous studies. Papadimitriou et al. (1998) found an association between a 282-bp CA repeat in the gene encoding GABRA5 and bipolar affective disorder in 48 unrelated southern Greek patients but not in 50 healthy individuals drawn from the same population. No association was seen in another sample of 40 unipolar patients in the same specimen. Even though the authors applied the Bonferroni correction for the total numbers of genes tested, they cautioned that the level of significance in association studies is still a matter of debate. They believed that the 282-bp allele is unlikely to have functional significance but does not represent stratification in their sample. Rather, they considered that the allele may be in linkage disequilibrium with a functional mutation elsewhere in the GABRA5 gene or another gene in close proximity. Ritchie et al. (1998) reported a partial duplication of GABRA5 within the imprinted 15q11-q13 region. The duplicated locus mapped to the pericentromeric region of 15q, proximal to the large deletions associated Angelman and Prader-Willi syndromes. They also observed variation in the number of copies of this locus in different individuals, indicating that the duplication is part of the variable repeat. Investigation of the duplication in individuals with

a normal karyotype revealed between 1 and 4 copies of the repeat on each chromosome 15, whereas from 8 to 20 copies were found in individuals possessing a cytogenetically detectable elongation of the 15q region. The variable region is roughly 1 Mb long and contains 2 other nonprocessed duplications, the immunoglobulin heavy chain (IgH) D segment gene (IGHD; 147170) on 14q and the neurofibromatosis type 1 gene (NF1; 162200) on chromosome 17. One unit of the pericentromeric repeat is thus composed of duplications of genes from different chromosomal regions. Ritchie et al. (1998) also found replication asynchrony across the GABRA5 duplication, suggesting for the first time that the imprinted part of chromosome 15q extends proximal of the region commonly deleted in Angelman and Prader-Willi syndromes.

[33245] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33246] Ritchie, R. J.; Mattei, M.-G.; Lalande, M. : A large polymorphic repeat in the pericentromeric region of human chromosome 15q contains three partial gene duplications. Hum. Molec. Genet. 7: 1253-1260, 1998. ; and

[33247] Papadimitriou, G. N.; Dikeos, D. G.; Karadima, G.;

Avramopoulos, D.; Daskalopoulou, E. G.; Vassilopoulos, D.; Stefanis, C. N. : Association between the GABA-A receptor alpha-5 subunit ge.

[33248] Further studies establishing the function and utilities of GABRA5 are found in John Hopkins OMIM database record ID 137142, and in cited publications numbered 628-634 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyaluronan Synthase 2 (HAS2, Accession NM\_005328) is another VGAM874 host target gene. HAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS2 BINDING SITE, designated SEQ ID:11800, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33249] Another function of VGAM874 is therefore inhibition of Hyaluronan Synthase 2 (HAS2, Accession NM\_005328), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis and transport . Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HAS2. The function of HAS2 has been established by previous studies. Hyaluronan, or hyaluronic acid (HA), is a high molecular weight unbranched polysaccharide of the extracellular matrix. Watanabe and Yamaguchi (1996) described the cloning of a human cDNA from a fibroblast library using degenerate PCR with primers based on regions of conservation between the previously published *Xenopus* DG42 and *Streptococcus* HasA proteins. When expressed in cell culture, the cDNA increased hyaluronan production. The sequence of the predicted 552-amino acid protein differs from HAS1 (OMIM Ref. No. 601463) and so was designated HAS2. The HAS2 amino acid sequence is 55% similar to the *Xenopus* DG42 sequence and 55% identical to mouse Has1. Northern blots showed high levels of HAS2 mRNA in a proliferating human fibroblast cell line but not in growth-arrested cells. Watanabe and Yamaguchi (1996) speculated that if HAS2 is not a true hyaluronan synthase, it is at least a major inducer of HA synthase activity. Spicer et al. (1996) isolated the apparent mouse homolog of human HAS2 from a mouse embryo cDNA library using degenerate PCR. The predicted mouse protein is also 552 amino acids long. The Has2 protein is predicted to contain

multiple transmembrane domains similar to bacterial HasA and mammalian HAS1. Northern blots demonstrated 4.8- and 3.2-kb transcripts expressed highly in the mouse embryo and at lower levels in adult heart, brain, spleen, lung, and skeletal muscle. When expressed in COS cells, the cDNA was shown to induce the formation of large HA coats around the cells. Based on analogy with what is known about HA production in *Streptococcus*, Spicer et al. (1996) suggested that HAS2 may play a key role in HA transport rather than act as a synthase per se.

[33250] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33251] Watanabe, K.; Yamaguchi, Y. : Molecular identification of a putative human hyaluronan synthase. *J. Biol. Chem.* 271: 22945–22948, 1996. ; and

[33252] Spicer, A. P.; Augustine, M. L.; McDonald, J. A. : Molecular cloning and characterization of a putative mouse hyaluronan synthase. *J. Biol. Chem.* 271: 23400–23406, 1996.

[33253] Further studies establishing the function and utilities of HAS2 are found in John Hopkins OMIM database record ID 601636, and in cited publications numbered 6682–2755 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM874 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13656, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33254] Another function of VGAM874 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. WTAP (Accession NM\_004906) is another VGAM874 host target gene. WTAP BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by WTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WTAP BINDING SITE, designated SEQ ID:11344, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33255] Another function of VGAM874 is therefore inhibition of WTAP (Accession NM\_004906), a gene which plays a role in both transcriptional and posttranscriptional regulation of certain cellular genes. Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WTAP. The function of WTAP has been established by previous studies. The Wilms tumor suppressor gene WT1 (OMIM Ref. No. 607102) appears to play a role in both transcriptional and posttranscriptional regulation of certain cellular genes. Little et al. (2000) used the yeast 2-hybrid system to identify a novel human WT1-associating protein, which they called WTAP, containing 388 amino acids. They also identified the mouse homolog and found that the 2 proteins share 96% sequence identity. Both in vitro and in vivo assays demonstrated a specific interaction between

WTAP and WT1, which occurred endogenously in cells.

The authors found that WTAP is a ubiquitously expressed nuclear protein which, like WT1, localized throughout the nucleoplasm as well as in speckles and partially colocalized with splicing factors. Using a panel of human-rodent hybrid cell lines, Nagase et al. (1995) mapped the WTAP gene, which they designated KIAA0105, to chromosome 6. By fluorescence in situ hybridization, Little et al. (2000) assigned the human WTAP gene to chromosome 6q25-q27 and the mouse homolog to a region of syntenic homology on chromosome 17

[33256] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33257] Little, N. A.; Hastie, N. D.; Davies, R. C. : Identification of WTAP, a novel Wilms' tumour 1-associating protein. Hum. Molec. Genet. 9: 2231-2239, 2000. ; and

[33258] Nagase, T.; Miyajima, N.; Tanaka, A.; Sazuka, T.; Seki, N.; Sato, S.; Tabata, S.; Ishikawa, K.; Kawarabayasi, Y.; Kotani, H.; Nomura, N. : Prediction of the coding sequences of unidentified.

[33259] Further studies establishing the function and utilities of WTAP are found in John Hopkins OMIM database record ID

605442, and in cited publications numbered 5025 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cysteine and Tyrosine-rich 1 (CYR1, Accession NM\_052954) is another VGAM874 host target gene. CYR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYR1 BINDING SITE, designated SEQ ID:27515, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33260] Another function of VGAM874 is therefore inhibition of Cysteine and Tyrosine-rich 1 (CYR1, Accession NM\_052954). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYR1. FLJ21945 (Accession NM\_025203) is another VGAM874 host target gene. FLJ21945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21945 BINDING SITE, designated SEQ ID:24867, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33261] Another function of VGAM874 is therefore inhibition of FLJ21945 (Accession NM\_025203). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21945. HTEX4 (Accession XM\_166378) is another VGAM874 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44214, SEQ ID:46650 and SEQ ID:46719 respectively, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33262] Another function of VGAM874 is therefore inhibition of HTEX4 (Accession XM\_166378). Accordingly, utilities of

VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. LOC147353 (Accession XM\_097227) is another VGAM874 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40837, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33263] Another function of VGAM874 is therefore inhibition of LOC147353 (Accession XM\_097227). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC148530 (Accession XM\_097480) is another VGAM874 host target gene. LOC148530 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148530 BINDING SITE, designated SEQ ID:40887, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33264] Another function of VGAM874 is therefore inhibition of LOC148530 (Accession XM\_097480). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148530. LOC149827 (Accession XM\_097762) is another VGAM874 host target gene. LOC149827 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149827 BINDING SITE, designated SEQ ID:41111, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33265] Another function of VGAM874 is therefore inhibition of LOC149827 (Accession XM\_097762). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149827. LOC158490 (Accession XM\_088585) is another VGAM874 host target gene. LOC158490 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by LOC158490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158490 BINDING SITE, designated SEQ ID:39847, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33266] Another function of VGAM874 is therefore inhibition of LOC158490 (Accession XM\_088585). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158490. LOC196484 (Accession XM\_031807) is another VGAM874 host target gene. LOC196484 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by LOC196484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196484 BINDING SITE, designated SEQ ID:31484, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33267] Another function of VGAM874 is therefore inhibition of

LOC196484 (Accession XM\_031807). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196484. LOC220073 (Accession XM\_167847) is another VGAM874 host target gene. LOC220073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220073 BINDING SITE, designated SEQ ID:44872, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33268] Another function of VGAM874 is therefore inhibition of LOC220073 (Accession XM\_167847). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220073. LOC222160 (Accession XM\_168431) is another VGAM874 host target gene. LOC222160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45164, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33269] Another function of VGAM874 is therefore inhibition of LOC222160 (Accession XM\_168431). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. LOC91069 (Accession XM\_035824) is another VGAM874 host target gene. LOC91069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91069 BINDING SITE, designated SEQ ID:32344, to the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, also designated SEQ ID:3585.

[33270] Another function of VGAM874 is therefore inhibition of LOC91069 (Accession XM\_035824). Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91069. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 875 (VGAM875) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33271] VGAM875 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM875 was detected is described hereinabove with reference to Figs. 1–8.

[33272] VGAM875 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33273] VGAM875 gene encodes a VGAM875 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM875 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM875 precursor RNA is designated SEQ ID:861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:861 is

located at position 28481 relative to the genome of Human Herpesvirus 5.

[33274] VGAM875 precursor RNA folds onto itself, forming VGAM875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33275] An enzyme complex designated DICER COMPLEX, `dices` the VGAM875 folded precursor RNA into VGAM875 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM875 RNA is designated SEQ ID:3586, and is provided hereinbelow with reference to the sequence listing part.

[33276] VGAM875 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM875 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33277] VGAM875 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM875 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM875 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM875 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[33278] The complementary binding of VGAM875 RNA, herein designated VGAM RNA, to host target binding sites on VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM875 host target RNA into VGAM875 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33279] It is appreciated that VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM875 host target genes. The mRNA of each one of this plurality of VGAM875 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM875 RNA, herein designated VGAM RNA, and which when bound by VGAM875 RNA causes inhibition of translation of respective one or more VGAM875

host target proteins.

[33280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM875 gene, herein designated VGAM GENE, on one or more VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33281] It is yet further appreciated that a function of VGAM875 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM875 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Spe-

cific functions, and accordingly utilities, of VGAM875 correlate with, and may be deduced from, the identity of the host target genes which VGAM875 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33282] Nucleotide sequences of the VGAM875 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM875 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM875 are further described hereinbelow with reference to Table 1.

[33283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM875 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM875 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33284] As mentioned hereinabove with reference to Fig. 1, a function of VGAM875 gene, herein designated VGAM is inhibition of expression of VGAM875 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM875 correlate with, and may be deduced from, the identity of the target genes which VGAM875 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33285] MGC10818 (Accession NM\_030568) is a VGAM875 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:24942, to the nucleotide sequence of VGAM875 RNA, herein designated VGAM RNA, also designated SEQ ID:3586.

[33286] A function of VGAM875 is therefore inhibition of MGC10818 (Accession NM\_030568). Accordingly, utilities of VGAM875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. SV2B (Accession NM\_014848) is another VGAM875 host target gene. SV2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2B BINDING SITE, designated SEQ ID:16881, to the nucleotide sequence of VGAM875 RNA, herein designated VGAM RNA, also designated SEQ ID:3586.

[33287] Another function of VGAM875 is therefore inhibition of SV2B (Accession NM\_014848). Accordingly, utilities of VGAM875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 876 (VGAM876) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33288] VGAM876 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM876 was detected is described hereinabove with reference to Figs. 1–8.

[33289] VGAM876 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[33290] VGAM876 gene encodes a VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM876 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM876 precursor RNA is designated SEQ ID:862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:862 is located at position 29679 relative to the genome of Human Herpesvirus 5.

[33291] VGAM876 precursor RNA folds onto itself, forming VGAM876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33292] An enzyme complex designated DICER COMPLEX, `dices` the VGAM876 folded precursor RNA into VGAM876 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM876 RNA is designated SEQ ID:3587, and is provided hereinbelow with reference to the sequence listing part.

[33293] VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM876 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33294] VGAM876 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM876 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM876 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33295] The complementary binding of VGAM876 RNA, herein designated VGAM RNA, to host target binding sites on VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM876 host target RNA into VGAM876 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33296] It is appreciated that VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM876 host target genes. The mRNA of each one of this plurality of VGAM876 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM876 RNA, herein designated VGAM RNA, and which when bound by VGAM876 RNA causes inhibition of translation of respective one or more VGAM876 host target proteins.

[33297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM876 gene, herein designated VGAM GENE, on one or more VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33298] It is yet further appreciated that a function of VGAM876 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM876 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM876 correlate with, and may be deduced from, the identity of the host target genes which VGAM876 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33299] Nucleotide sequences of the VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM876 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM876 are further described hereinbelow with reference to Table 1.

[33300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM876 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM876 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33301] As mentioned hereinabove with reference to Fig. 1, a function of VGAM876 gene, herein designated VGAM is inhibition of expression of VGAM876 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM876 correlate with, and may be deduced from, the identity of the target genes which VGAM876 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33302] EH-domain Containing 2 (EHD2, Accession NM\_014601) is a VGAM876 host target gene. EHD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:15960, to the nucleotide sequence of VGAM876 RNA, herein designated VGAM RNA, also designated SEQ ID:3587.

[33303] A function of VGAM876 is therefore inhibition of EH-domain Containing 2 (EHD2, Accession NM\_014601). Accordingly, utilities of VGAM876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2. LOC51289 (Accession NM\_016568) is another VGAM876 host target gene. LOC51289 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51289 BINDING SITE, designated SEQ ID:18639, to the nucleotide sequence of VGAM876 RNA, herein designated VGAM RNA, also designated SEQ ID:3587.

[33304] Another function of VGAM876 is therefore inhibition of LOC51289 (Accession NM\_016568). Accordingly, utilities of VGAM876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51289. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 877 (VGAM877) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[33305] VGAM877 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM877 was detected is described hereinabove with reference to Figs. 1–8.

[33306] VGAM877 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33307] VGAM877 gene encodes a VGAM877 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM877 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM877 precursor RNA is designated SEQ ID:863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:863 is located at position 27633 relative to the genome of Human Herpesvirus 5.

[33308] VGAM877 precursor RNA folds onto itself, forming VGAM877 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[33309] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM877 folded precursor RNA into VGAM877 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 79%) nucleotide se-  
quence of VGAM877 RNA is designated SEQ ID:3588, and  
is provided hereinbelow with reference to the sequence  
listing part.

[33310] VGAM877 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM877 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM877 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33311] VGAM877 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM877 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM877 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33312] The complementary binding of VGAM877 RNA, herein designated VGAM RNA, to host target binding sites on VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM877 host target RNA into VGAM877 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33313] It is appreciated that VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM877 host target genes. The mRNA of each one of this plurality of VGAM877 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM877 RNA, herein designated VGAM RNA, and which when bound by VGAM877 RNA causes inhibition of translation of respective one or more VGAM877 host target proteins.

[33314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM877 gene, herein designated VGAM GENE, on one or more VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33315] It is yet further appreciated that a function of VGAM877 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM877 correlate with, and may be deduced from, the identity of the host target genes which VGAM877 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [33316] Nucleotide sequences of the VGAM877 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM877 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM877 are further described hereinbelow with reference to Table 1.
- [33317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM877 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM877 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33318] As mentioned hereinabove with reference to Fig. 1, a function of VGAM877 gene, herein designated VGAM is inhibition of expression of VGAM877 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM877 correlate with, and may be deduced from, the identity of the target genes which VGAM877 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33319] Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM\_004389) is a VGAM877 host target gene. CTNNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNA2 BINDING SITE, designated SEQ ID:10618, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33320] A function of VGAM877 is therefore inhibition of Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM\_004389), a gene which is involved in the cytoplasmic anchorage of cell-cell and cell-substrate adhesion molecules. Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNA2. The function of CTNNA2 has been established by previous studies. Cell-cell and cell-matrix adhesions involve transmembrane glycoproteins such as cell adhesion molecules and integrins, which are thought to function via interactions of their cytoplasmic domains with proteins associated with

the cytoskeleton. Vinculin (OMIM Ref. No. 193065) and talin (OMIM Ref. No. 186745) are examples. The activity of cadherins (e.g., 114020), which mediate homophilic cell-cell  $\text{Ca}^{2+}$ -dependent association, depends on their anchorage to cytoskeleton via proteins termed catenins (Herrenknecht et al., 1991). Animal model experiments lend further support to the function of CTNNA2. Mice homozygous for the 'cerebellar-deficient folia' (cdf) mutation are ataxic and have cerebellar hypoplasia and abnormal lobulation of the cerebellum (Cook et al., 1997). In the cerebella of cdf/cdf homozygous mice, approximately 40% of Purkinje cells are located ectopically in the white matter and inner granule-cell layer. Many hippocampal pyramidal cells are scattered in the plexiform layers, and those that are correctly positioned are less densely packed than are cells in wildtype mice. Park et al. (2002) showed that fear conditioning and prepulse inhibition of the startle response are also disrupted in cdf/cdf mice. They identified a deletion on mouse chromosome 6 that removed approximately 150 kb of the cdf region. The deletion included part of *Catna2*, encoding alpha-N-catenin, a protein that links the classic cadherins to the neuronal cytoskeleton. Expression of a *Catna2* transgene in cdf/cdf

mice restored normal cerebellar and hippocampal morphology, prepulse inhibition, and fear conditioning. The findings suggested that catenin–cadherin cell–adhesion complexes are important in cerebellar and hippocampal lamination and in the control of startle modulation.

[33321] It is appreciated that the abovementioned animal model for CTNNA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[33322] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33323] Claverie, J.–M.; Hardelin, J.–P.; Legouis, R.; Levilliers, J.; Bougueleret, L.; Mattei, M.–G.; Petit, C. : Characterization and chromosomal assignment of a human cDNA encoding a protein related to the murine 102–kDa cadherin–associated protein (alpha–catenin). *Genomics* 15: 13–20, 1993. ; and

[33324] Park, C.; Falls, W.; Finger, J. H.; Longo–Guess, C. M.; Ackerman, S. L. : Deletion in *Catna2*, encoding alpha–N–catenin, causes cerebellar and hippocampal lamination defects and impaired.

[33325] Further studies establishing the function and utilities of

CTNNA2 are found in John Hopkins OMIM database record ID 114025, and in cited publications numbered 11654–11655, 982 and 11656–11657 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216) is another VGAM877 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:5716, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33326] Another function of VGAM877 is therefore inhibition of Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216). Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343) is another VGAM877 host target gene. NBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by NBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBS1 BINDING SITE, designated SEQ ID:34436, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33327] Another function of VGAM877 is therefore inhibition of Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343), a gene which may be involved in repair of DNA double-strand breaks. Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBS1. The function of NBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. Oligophrenin 1 (OPHN1, Accession NM\_002547) is another VGAM877 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

OPHN1 BINDING SITE, designated SEQ ID:8403, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33328] Another function of VGAM877 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM\_002547). Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM\_004842) is another VGAM877 host target gene. AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3, designated SEQ ID:11253, SEQ ID:18516 and SEQ ID:28906 respectively, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33329] Another function of VGAM877 is therefore inhibition of A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM\_004842). Accordingly, utilities of VGAM877 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7. Histidyl-tRNA Synthetase-like (HARSL, Accession NM\_012208) is another VGAM877 host target gene. HARSL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HARSL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HARSL BINDING SITE, designated SEQ ID:14509, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33330] Another function of VGAM877 is therefore inhibition of Histidyl-tRNA Synthetase-like (HARSL, Accession NM\_012208). Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HARSL. KIAA1939 (Accession NM\_024837) is another VGAM877 host target gene. KIAA1939 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA1939 BINDING SITE, designated SEQ ID:24243, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33331] Another function of VGAM877 is therefore inhibition of KIAA1939 (Accession NM\_024837). Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1939. LOC144699 (Accession XM\_084940) is another VGAM877 host target gene. LOC144699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144699 BINDING SITE, designated SEQ ID:37769, to the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, also designated SEQ ID:3588.

[33332] Another function of VGAM877 is therefore inhibition of LOC144699 (Accession XM\_084940). Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144699. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 878 (VGAM878) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33333] VGAM878 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM878 was detected is described hereinabove with reference to Figs. 1–8.

[33334] VGAM878 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus. VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33335] VGAM878 gene encodes a VGAM878 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM878 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM878 precursor RNA is designated SEQ ID:864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:864 is

located at position 106591 relative to the genome of Swinepox Virus.

[33336] VGAM878 precursor RNA folds onto itself, forming VGAM878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33337] An enzyme complex designated DICER COMPLEX, `dices` the VGAM878 folded precursor RNA into VGAM878 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM878 RNA is designated SEQ ID:3589, and is provided hereinbelow with reference to the sequence listing part.

[33338] VGAM878 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM878 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33339] VGAM878 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM878 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM878 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM878 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33340] The complementary binding of VGAM878 RNA, herein designated VGAM RNA, to host target binding sites on VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM878 host target RNA into VGAM878 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33341] It is appreciated that VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM878 host target genes. The mRNA of each one of this plurality of VGAM878 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM878 RNA, herein designated VGAM RNA, and which when bound by VGAM878 RNA causes inhibition of translation of respective one or more VGAM878

host target proteins.

[33342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM878 gene, herein designated VGAM GENE, on one or more VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33343] It is yet further appreciated that a function of VGAM878 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM878 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific

functions, and accordingly utilities, of VGAM878 correlate with, and may be deduced from, the identity of the host target genes which VGAM878 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33344] Nucleotide sequences of the VGAM878 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM878 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM878 are further described hereinbelow with reference to Table 1.

[33345] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM878 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM878 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33346] As mentioned hereinabove with reference to Fig. 1, a function of VGAM878 gene, herein designated VGAM is inhibition of expression of VGAM878 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM878 correlate with, and may be deduced from, the identity of the target genes which VGAM878 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33347] Protocadherin Beta 8 (PCDHB8, Accession NM\_019120) is a VGAM878 host target gene. PCDHB8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDHB8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB8 BINDING SITE, designated SEQ ID:21207, to the nucleotide sequence of VGAM878 RNA, herein designated VGAM RNA, also designated SEQ ID:3589.

[33348] A function of VGAM878 is therefore inhibition of Protocadherin Beta 8 (PCDHB8, Accession NM\_019120). Accordingly, utilities of VGAM878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB8. LOC145871 (Accession XM\_096897) is another VGAM878 host target gene. LOC145871 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145871, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145871 BINDING SITE, designated SEQ ID:40622, to the nucleotide sequence of VGAM878 RNA, herein designated VGAM RNA, also designated SEQ ID:3589.

[33349] Another function of VGAM878 is therefore inhibition of LOC145871 (Accession XM\_096897). Accordingly, utilities of VGAM878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145871. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 879 (VGAM879) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33350] VGAM879 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM879 was detected is described hereinabove with reference to Figs. 1–8.

[33351] VGAM879 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta Moorei Ento–

mopoxvirus. VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33352] VGAM879 gene encodes a VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM879 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM879 precursor RNA is designated SEQ ID:865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:865 is located at position 137324 relative to the genome of Am-sacta Moorei Entomopoxvirus.

[33353] VGAM879 precursor RNA folds onto itself, forming VGAM879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33354] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM879 folded precursor RNA into VGAM879 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM879 RNA is designated SEQ ID:3590, and is provided hereinbelow with reference to the sequence listing part.

[33355] VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM879 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33356] VGAM879 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM879 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM879 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33357] The complementary binding of VGAM879 RNA, herein designated VGAM RNA, to host target binding sites on VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM879 host target RNA into VGAM879 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33358] It is appreciated that VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM879 host target genes. The mRNA of each one of this plurality of VGAM879 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM879 RNA, herein designated VGAM RNA, and which when bound by VGAM879 RNA causes inhibition of translation of respective one or more VGAM879 host target proteins.

[33359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM879 gene, herein designated VGAM GENE, on one or more VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33360] It is yet further appreciated that a function of VGAM879 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM879 include diagnosis, prevention and treatment of viral infection by Amsacta Moorei Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM879 correlate with, and may be deduced from, the identity of the host target genes which VGAM879 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33361] Nucleotide sequences of the VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM879 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM879 are further described hereinbelow with reference to Table 1.

[33362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM879 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM879 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33363] As mentioned hereinabove with reference to Fig. 1, a function of VGAM879 gene, herein designated VGAM is inhibition of expression of VGAM879 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM879 correlate with, and may be deduced from, the identity of the target genes which VGAM879 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33364] KIAA0256 (Accession XM\_034905) is a VGAM879 host target gene. KIAA0256 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0256 BINDING SITE, designated SEQ ID:32184, to the nucleotide sequence of

VGAM879 RNA, herein designated VGAM RNA, also designated SEQ ID:3590.

[33365] A function of VGAM879 is therefore inhibition of KIAA0256 (Accession XM\_034905). Accordingly, utilities of VGAM879 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0256. TOLLIP (Accession NM\_019009) is another VGAM879 host target gene. TOLLIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOLLIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOLLIP BINDING SITE, designated SEQ ID:21094, to the nucleotide sequence of VGAM879 RNA, herein designated VGAM RNA, also designated SEQ ID:3590.

[33366] Another function of VGAM879 is therefore inhibition of TOLLIP (Accession NM\_019009). Accordingly, utilities of VGAM879 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOLLIP. LOC133744 (Accession XM\_059669) is another VGAM879 host target gene. LOC133744 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of

mRNA encoded by LOC133744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133744 BINDING SITE, designated SEQ ID:37059, to the nucleotide sequence of VGAM879 RNA, herein designated VGAM RNA, also designated SEQ ID:3590.

[33367] Another function of VGAM879 is therefore inhibition of LOC133744 (Accession XM\_059669). Accordingly, utilities of VGAM879 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133744. LOC203369 (Accession XM\_114689) is another VGAM879 host target gene. LOC203369 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203369 BINDING SITE, designated SEQ ID:43031, to the nucleotide sequence of VGAM879 RNA, herein designated VGAM RNA, also designated SEQ ID:3590.

[33368] Another function of VGAM879 is therefore inhibition of LOC203369 (Accession XM\_114689). Accordingly, utilities

of VGAM879 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203369. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 880 (VGAM880) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33369] VGAM880 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM880 was detected is described hereinabove with reference to Figs. 1–8.

[33370] VGAM880 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 3. VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33371] VGAM880 gene encodes a VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM880 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM880 precursor RNA is designated SEQ ID:866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:866 is located at position 52351 relative to the genome of Gallid Herpesvirus 3.

[33372] VGAM880 precursor RNA folds onto itself, forming VGAM880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33373] An enzyme complex designated DICER COMPLEX, `dices` the VGAM880 folded precursor RNA into VGAM880 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM880 RNA is designated SEQ ID:3591, and

is provided hereinbelow with reference to the sequence listing part.

[33374] VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM880 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33375] VGAM880 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM880 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM880 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33376] The complementary binding of VGAM880 RNA, herein designated VGAM RNA, to host target binding sites on VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM880 host target RNA into VGAM880 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33377] It is appreciated that VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM880 host target genes. The mRNA of each one of this plurality of VGAM880 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM880 RNA, herein designated VGAM RNA, and which when bound by VGAM880 RNA causes inhibition of translation of respective one or more VGAM880 host target proteins.

[33378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM880 gene, herein designated VGAM GENE, on one or more VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33379] It is yet further appreciated that a function of VGAM880 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM880 correlate with, and may be deduced from, the identity of the host target genes which VGAM880 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33380] Nucleotide sequences of the VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM880 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM880 are further described hereinbelow with reference to Table 1.

[33381] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM880 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM880 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33382] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM880 gene, herein designated VGAM is inhibition of expression of VGAM880 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM880 correlate with, and may be deduced from, the identity of the target genes which VGAM880 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33383] Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921) is a VGAM880 host target gene. CLCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCA3 BINDING SITE, designated SEQ ID:11355, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33384] A function of VGAM880 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921), a gene which is similar to calcium-activated chloride channel family. Accordingly, utilities of VGAM880 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with CLCA3. The function of CLCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Engulfment and Cell Motility 2 (ced-12 homolog, *C. elegans*) (ELMO2, Accession NM\_133171) is another VGAM880 host target gene. ELMO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO2 BINDING SITE, designated SEQ ID:28394, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33385] Another function of VGAM880 is therefore inhibition of Engulfment and Cell Motility 2 (ced-12 homolog, *C. elegans*) (ELMO2, Accession NM\_133171). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELMO2. LFG (Accession XM\_084780) is another VGAM880 host target gene. LFG BINDING SITE is HOST TARGET bind-

ing site found in the 3` untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37690, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33386] Another function of VGAM880 is therefore inhibition of LFG (Accession XM\_084780). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM\_001047) is another VGAM880 host target gene. SRD5A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRD5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRD5A1 BINDING SITE, designated SEQ ID:6717, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ

ID:3591.

[33387] Another function of VGAM880 is therefore inhibition of Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM\_001047), a gene which catalyzes the conversion of testosterone into 5-alpha-dihydrotestosterone and progesterone . Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A1. The function of SRD5A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM749. Di-Ras2 (Accession NM\_017594) is another VGAM880 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:19047, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33388] Another function of VGAM880 is therefore inhibition of

Di-Ras2 (Accession NM\_017594). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. FLJ12700 (Accession NM\_024910) is another VGAM880 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24417, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33389] Another function of VGAM880 is therefore inhibition of FLJ12700 (Accession NM\_024910). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. KIAA0427 (Accession NM\_014772) is another VGAM880 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16581, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33390] Another function of VGAM880 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA1223 (Accession XM\_048747) is another VGAM880 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35250, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33391] Another function of VGAM880 is therefore inhibition of KIAA1223 (Accession XM\_048747). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. KIAA1383 (Accession XM\_045859) is another

VGAM880 host target gene. KIAA1383 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1383 BINDING SITE, designated SEQ ID:34586, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33392] Another function of VGAM880 is therefore inhibition of KIAA1383 (Accession XM\_045859). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1383. KIAA1872 (Accession XM\_031917) is another VGAM880 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31524, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33393] Another function of VGAM880 is therefore inhibition of KIAA1872 (Accession XM\_031917). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM\_003184) is another VGAM880 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:9159, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33394] Another function of VGAM880 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM\_003184). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. LOC144262 (Accession XM\_084793) is another VGAM880 host target gene. LOC144262 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC144262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144262 BINDING SITE, designated SEQ ID:37706, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33395] Another function of VGAM880 is therefore inhibition of LOC144262 (Accession XM\_084793). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144262. LOC149103 (Accession XM\_086434) is another VGAM880 host target gene. LOC149103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149103 BINDING SITE, designated SEQ ID:38650, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33396] Another function of VGAM880 is therefore inhibition of

LOC149103 (Accession XM\_086434). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149103. LOC199733 (Accession XM\_117123) is another VGAM880 host target gene. LOC199733 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199733 BINDING SITE, designated SEQ ID:43247, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33397] Another function of VGAM880 is therefore inhibition of LOC199733 (Accession XM\_117123). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199733. LOC253805 (Accession XM\_172854) is another VGAM880 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46132, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33398] Another function of VGAM880 is therefore inhibition of LOC253805 (Accession XM\_172854). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253805. LOC90321 (Accession XM\_030896) is another VGAM880 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:31211, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33399] Another function of VGAM880 is therefore inhibition of LOC90321 (Accession XM\_030896). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. LOC92249 (Accession XM\_043814) is another

VGAM880 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34021, to the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, also designated SEQ ID:3591.

[33400] Another function of VGAM880 is therefore inhibition of LOC92249 (Accession XM\_043814). Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 881 (VGAM881) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33401] VGAM881 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM881 was detected is described

hereinabove with reference to Figs. 1–8.

[33402] VGAM881 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 3.

VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33403] VGAM881 gene encodes a VGAM881 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM881 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM881 precursor RNA is designated SEQ ID:867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:867 is located at position 51459 relative to the genome of Gallid Herpesvirus 3.

[33404] VGAM881 precursor RNA folds onto itself, forming VGAM881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[33405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM881 folded precursor RNA into VGAM881 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM881 RNA is designated SEQ ID:3592, and is provided hereinbelow with reference to the sequence listing part.

[33406] VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM881 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33407] VGAM881 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM881 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM881 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33408] The complementary binding of VGAM881 RNA, herein designated VGAM RNA, to host target binding sites on VGAM881 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM881 host target RNA into VGAM881 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33409] It is appreciated that VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM881 host target genes. The mRNA of each one of this plurality of VGAM881 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM881 RNA, herein designated VGAM RNA, and which when bound by VGAM881 RNA causes inhibition of translation of respective one or more VGAM881 host target proteins.

[33410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM881 gene, herein designated VGAM GENE, on one or more VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33411] It is yet further appreciated that a function of VGAM881 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM881 correlate with, and may be deduced from, the identity of the host target genes which VGAM881 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33412] Nucleotide sequences of the VGAM881 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM881 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM881 are further described hereinbelow with reference to Table 1.

[33413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM881 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM881 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM881 gene, herein designated VGAM is inhibition of expression of VGAM881 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM881 correlate with, and may be deduced from, the identity of the target genes which VGAM881 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33415] Carnitine O-octanoyltransferase (CROT, Accession NM\_021151) is a VGAM881 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22121, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33416] A function of VGAM881 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM\_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid. Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT. The function of CROT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM70. Dual Specificity Phosphatase 1 (DUSP1, Accession NM\_004417) is another VGAM881 host target gene. DUSP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP1 BINDING SITE, designated SEQ ID:10680, to the nucleotide sequence of

VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33417] Another function of VGAM881 is therefore inhibition of Dual Specificity Phosphatase 1 (DUSP1, Accession NM\_004417), a gene which is a dual specificity phosphatase . Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP1. The function of DUSP1 has been established by previous studies. Keyse and Em-  
slie (1992) isolated and characterized a cDNA, which they designated CL100, corresponding to an mRNA that is highly inducible by oxidative stress and heat shock in human skin cells. The cDNA was obtained by differential screening of a library made from normal human skin fibroblasts stressed for 2 hours in a solution of hydrogen peroxide. The cDNA contains an open reading frame specifying a 367-residue protein of 39.3 kD predicted molecular mass with the structural features of a nonreceptor type protein-tyrosine phosphatase. It has significant amino acid sequence similarity to a tyr/ser-protein phosphatase encoded by the late gene H1 of vaccinia virus. The purified protein encoded by the open reading frame expressed in bacteria has intrinsic phosphatase ac-

tivity. Given the relationship between the levels of protein-tyrosine phosphorylation, receptor activity, cellular proliferation, and cell cycle control, Keyse and Emslie (1992) concluded that induction of this gene may play an important regulatory role in the human cellular response to environmental stress. Brondello et al. (1999) determined that DUSP1, which they called MKP1, is a labile protein with a half-life of approximately 45 minutes in CCL39 hamster fibroblasts. Its degradation was attenuated by inhibitors of the ubiquitin-directed proteasome complex. MKP1 was a target in vivo and in vitro for p42MAPK (OMIM Ref. No. 176948) or p44MAPK (OMIM Ref. No. 601795), which phosphorylates MKP1 on 2 C-terminal serine residues, ser359 and ser364. This phosphorylation did not modify MKP1's intrinsic ability to dephosphorylate p44MAPK, but led to stabilization of the protein. Brondello et al. (1999) concluded that these results illustrated the importance of regulated protein degradation in the control of mitogenic signaling.

[33418] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33419] Brondello, J.-M.; Pouyssegur, J.; McKenzie, F. R. : Reduced

MAP kinase phosphatase-1 degradation after p42/p44(MAPK)-dependent phosphorylation. Science 286: 2514-2517, 1999. ; and

[33420] Keyse, S. M.; Emslie, E. A. : Oxidative stress and heat shock induce a human gene encoding a protein-tyrosine phosphatase. Nature 359: 644-647, 1992.

[33421] Further studies establishing the function and utilities of DUSP1 are found in John Hopkins OMIM database record ID 600714, and in cited publications numbered 1005 and 10052-10055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM\_165873) is another VGAM881 host target gene. HUS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:43788, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33422] Another function of VGAM881 is therefore inhibition of HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession

XM\_165873), a gene which May form DNA damage–responsive protein complex . Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1. The function of HUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228. Muscleblind–like (Drosophila) (MBNL, Accession NM\_021038) is another VGAM881 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22024, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33423] Another function of VGAM881 is therefore inhibition of Muscleblind–like (Drosophila) (MBNL, Accession NM\_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL.

The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.FIBL-6 (Accession XM\_053531) is another VGAM881 host target gene. FIBL-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FIBL-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIBL-6 BINDING SITE, designated SEQ ID:36099, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33424] Another function of VGAM881 is therefore inhibition of FIBL-6 (Accession XM\_053531). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIBL-6. FLJ30046 (Accession NM\_144595) is another VGAM881 host target gene. FLJ30046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ30046 BINDING SITE, designated SEQ ID:29410, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33425] Another function of VGAM881 is therefore inhibition of FLJ30046 (Accession NM\_144595). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30046. G Protein-coupled Receptor 105 (GPR105, Accession NM\_014879) is another VGAM881 host target gene. GPR105 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR105 BINDING SITE, designated SEQ ID:17022, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33426] Another function of VGAM881 is therefore inhibition of G Protein-coupled Receptor 105 (GPR105, Accession NM\_014879). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GPR105. KIAA0261 (Accession XM\_042946) is another VGAM881 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33829, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33427] Another function of VGAM881 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. KIAA1143 (Accession XM\_044014) is another VGAM881 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34069, to the

nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33428] Another function of VGAM881 is therefore inhibition of KIAA1143 (Accession XM\_044014). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM\_033285) is another VGAM881 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27109 and SEQ ID:36118 respectively, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33429] Another function of VGAM881 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM\_033285). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1.

LOC203305 (Accession XM\_117529) is another VGAM881 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43509, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33430] Another function of VGAM881 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM\_173233) is another VGAM881 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46511, to the nucleotide sequence of VGAM881 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3592.

[33431] Another function of VGAM881 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC90038 (Accession XM\_028305) is another VGAM881 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30648, to the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, also designated SEQ ID:3592.

[33432] Another function of VGAM881 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 882 (VGAM882) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33433] VGAM882 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM882 was detected is described hereinabove with reference to Figs. 1–8.

[33434] VGAM882 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33435] VGAM882 gene encodes a VGAM882 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM882 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM882 precursor RNA is designated SEQ ID:868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:868 is located at position 13598 relative to the genome of Meleagrid Herpesvirus 1.

[33436] VGAM882 precursor RNA folds onto itself, forming

VGAM882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33437] An enzyme complex designated DICER COMPLEX, `dices` the VGAM882 folded precursor RNA into VGAM882 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM882 RNA is designated SEQ ID:3593, and is provided hereinbelow with reference to the sequence listing part.

[33438] VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM882 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33439] VGAM882 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM882 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM882 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33440] The complementary binding of VGAM882 RNA, herein designated VGAM RNA, to host target binding sites on VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM882 host target RNA into VGAM882 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33441] It is appreciated that VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM882 host target genes. The mRNA of each one of this plurality of VGAM882 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM882 RNA, herein designated VGAM RNA, and which when bound by VGAM882 RNA causes inhibition of translation of respective one or more VGAM882 host target proteins.

[33442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM882 gene, herein designated VGAM GENE, on one or more VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33443] It is yet further appreciated that a function of VGAM882 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM882 correlate with, and may be deduced from, the identity of the host target genes which VGAM882 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[33444] Nucleotide sequences of the VGAM882 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM882 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM882 are further described hereinbelow with reference to Table 1.

[33445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM882 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM882 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33446] As mentioned hereinabove with reference to Fig. 1, a function of VGAM882 gene, herein designated VGAM is inhibition of expression of VGAM882 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM882 correlate with, and may be deduced from, the identity of the target genes which VGAM882 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[33447] Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM\_000706) is a VGAM882 host target gene. AVPR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AVPR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AVPR1A BINDING SITE, designated SEQ ID:6373, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33448] A function of VGAM882 is therefore inhibition of Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM\_000706), a gene which mediates cell contraction and proliferation, platelet aggregation, release of coagulation factor, and glycogenolysis. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVPR1A. The function of AVPR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM549.EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is another VGAM882 host target gene.

EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41885, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33449] Another function of VGAM882 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM\_049795) is another VGAM882 host target gene. EIF3S10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF3S10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S10 BINDING SITE, designated SEQ ID:35501, to the nucleotide sequence of

VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33450] Another function of VGAM882 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 10 Theta, 150/170kDa (EIF3S10, Accession XM\_049795), a gene which binds to the 40s ribosome and promotes the binding of methionyl-trnai and mrna. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S10. The function of EIF3S10 has been established by previous studies. Eukaryotic translation initiation factors (EIFs) initiate protein synthesis from mRNAs. EIF3, at 650 kD, is the largest of the EIFs. According to Johnson et al. (1997), EIF3 has been implicated in several roles, including binding to the 40S ribosomal subunit and to other EIFs, possibly to align the factors for initial binding to the 40S subunit and the subsequent identification of the AUG initiation codon. The EIF3 protein synthesis initiation factor is composed of at least 8 subunits, the largest of which is p180. Nagase et al. (1995) identified an open reading frame with significant homology to mouse centrosomin B. Nagase et al. (1995) noted that this clone, which they termed KIAA0139, was ubiquitously expressed and

contained 21 units of an unusual 10–amino acid repeat. The full–length cDNA was later cloned and characterized independently by Johnson et al. (1997) and Scholler and Kanner (1997). Johnson et al. (1997) used expression screening of a human liver cDNA library to isolate a clone, which they termed p180. The cDNA predicted a protein of 1,382 amino acids, which Johnson et al. (1997) identified as the human homolog of centrosomin, the large subunit of mouse eif3. Johnson et al. (1997) also showed that p180 has homologs in yeast, nematodes, and plants. Scholler and Kanner (1997) used expression screening of a human T–cell cDNA library to isolate a clone, termed p167 by them, that was nearly identical to that isolated by Johnson et al. (1997). Scholler and Kanner (1997) showed that p167 was a cytoplasmic protein that is not phosphorylated and is part of a multisubunit complex.

[33451] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33452] Johnson, K. R.; Merrick, W. C.; Zoll, W. L.; Zhu, Y. : Identification of cDNA clones for the large subunit of eukaryotic translation initiation factor 3: comparison of homologues from human, *Nicotiana tabacum*, *Caenorhabditis elegans*,

and *Saccharomyces cerevisiae*. J. Biol. Chem. 272:  
7106–7113, 1997. ; and

[33453] Scholler, J. K.; Kanner, S. B. : The human p167 gene encodes a unique structural protein that contains centrosomin A homology and associates with a multicomponent complex. DNA Cell Biol.

[33454] Further studies establishing the function and utilities of EIF3S10 are found in John Hopkins OMIM database record ID 602039, and in cited publications numbered 953–95 and 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071) is another VGAM882 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15287, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33455] Another function of VGAM882 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession

NM\_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Phenylalanine Hydroxylase (PAH, Accession NM\_000277) is another VGAM882 host target gene. PAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAH BINDING SITE, designated SEQ ID:5822, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33456] Another function of VGAM882 is therefore inhibition of Phenylalanine Hydroxylase (PAH, Accession NM\_000277). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAH. Tropomodulin (TMOD, Accession

NM\_003275) is another VGAM882 host target gene. TMOD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD BINDING SITE, designated SEQ ID:9292, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33457] Another function of VGAM882 is therefore inhibition of Tropomodulin (TMOD, Accession NM\_003275), a gene which blocks the elongation and depolymerization of the actin filaments at the pointed end. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD. The function of TMOD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM716. Protocadherin 20 (PCDH20, Accession NM\_022843) is another VGAM882 host target gene. PCDH20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH20, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH20 BINDING SITE, designated SEQ ID:23134, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33458] Another function of VGAM882 is therefore inhibition of Protocadherin 20 (PCDH20, Accession NM\_022843). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH20. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM\_024607) is another VGAM882 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23856, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33459] Another function of VGAM882 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B

(PPP1R3B, Accession NM\_024607). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. LOC151446 (Accession XM\_098061) is another VGAM882 host target gene. LOC151446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151446 BINDING SITE, designated SEQ ID:41351, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33460] Another function of VGAM882 is therefore inhibition of LOC151446 (Accession XM\_098061). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151446. LOC161823 (Accession XM\_091156) is another VGAM882 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40031, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33461] Another function of VGAM882 is therefore inhibition of LOC161823 (Accession XM\_091156). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. LOC221490 (Accession XM\_168084) is another VGAM882 host target gene. LOC221490 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221490 BINDING SITE, designated SEQ ID:44988, to the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, also designated SEQ ID:3593.

[33462] Another function of VGAM882 is therefore inhibition of LOC221490 (Accession XM\_168084). Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221490. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 883 (VGAM883) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33463] VGAM883 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM883 was detected is described hereinabove with reference to Figs. 1–8.

[33464] VGAM883 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 3. VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33465] VGAM883 gene encodes a VGAM883 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM883 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM883 precursor RNA is designated SEQ ID:869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:869 is

located at position 33063 relative to the genome of Gallid Herpesvirus 3.

[33466] VGAM883 precursor RNA folds onto itself, forming VGAM883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33467] An enzyme complex designated DICER COMPLEX, `dices` the VGAM883 folded precursor RNA into VGAM883 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM883 RNA is designated SEQ ID:3594, and is provided hereinbelow with reference to the sequence listing part.

[33468] VGAM883 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM883 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33469] VGAM883 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM883 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM883 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM883 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33470] The complementary binding of VGAM883 RNA, herein designated VGAM RNA, to host target binding sites on VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM883 host target RNA into VGAM883 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33471] It is appreciated that VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM883 host target genes. The mRNA of each one of this plurality of VGAM883 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM883 RNA, herein designated VGAM RNA, and which when bound by VGAM883 RNA causes inhibition of translation of respective one or more VGAM883

host target proteins.

[33472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM883 gene, herein designated VGAM GENE, on one or more VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33473] It is yet further appreciated that a function of VGAM883 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM883 correlate with, and may be deduced from, the identity of the host target genes which VGAM883 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33474] Nucleotide sequences of the VGAM883 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM883 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM883 are further described hereinbelow with reference to Table 1.

[33475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM883 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM883 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33476] As mentioned hereinabove with reference to Fig. 1, a function of VGAM883 gene, herein designated VGAM is inhibition of expression of VGAM883 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM883 correlate with, and may be deduced from, the identity of the target genes which VGAM883 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33477] Adenylate Cyclase 9 (ADCY9, Accession NM\_001116) is a VGAM883 host target gene. ADCY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY9 BINDING SITE, designated SEQ ID:6792, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33478] A function of VGAM883 is therefore inhibition of Adenylate Cyclase 9 (ADCY9, Accession NM\_001116), a gene which . may be a physiologically relevant docking site for calcineurin (by similarity). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY9. The function of ADCY9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM477.Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM\_001365) is another VGAM883 host target gene. DLG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG4 BINDING SITE, designated SEQ ID:7046, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33479] Another function of VGAM883 is therefore inhibition of Discs, Large (Drosophila) Homolog 4 (DLG4, Accession NM\_001365), a gene which is a membrane-associated guanylate kinase and may intervene in synaptogenesis. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG4. The function of DLG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.ELAV (embryonic lethal, abnormal vision, Drosophila)-like 3 (Hu antigen C) (ELAVL3, Accession NM\_001420) is another VGAM883 host target gene. ELAVL3 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by ELAVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELAVL3 BINDING SITE, designated SEQ ID:7120, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33480] Another function of VGAM883 is therefore inhibition of ELAV (embryonic lethal, abnormal vision, *Drosophila*)-like 3 (Hu antigen C) (ELAVL3, Accession NM\_001420), a gene which arises when an immune response to systemic tumors expressing neuronal proteins develops into an autoimmune neuronal degeneration. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAVL3. The function of ELAVL3 has been established by previous studies. Paraneoplastic neurologic disorders (PNDs) are a group of neurologic syndromes that arise when an immune response to systemic tumors expressing neuronal proteins develops into an autoimmune neuronal degeneration. Sakai et al. (1994) determined that the serum of a patient with paraneoplastic limbic encephalitis (PLE) con-

tained autoantibodies that recognized a 38-kD nuclear antigen in neural cells. By screening a hippocampus expression library with this serum, they isolated cDNAs encoding a protein that they called PLE21. The predicted 350-amino acid protein contains 3 RNA recognition motifs (RRMs). PLE21 shares 82% and 54% protein sequence identity with the human neural autoantigen HuD (OMIM Ref. No. 168360) and *Drosophila* ELAV protein, respectively. Northern blot analysis revealed that PLE21 is expressed as an approximately 2-kb mRNA exclusively in brain. Liu et al. (1995) stated that PLE21, or HuC, is one of several Hu antigens, neuronal-specific RNA-binding proteins recognized by the anti-Hu serum antibody present in sera from patients with paraneoplastic encephalomyelitis and sensory neuronopathy (PEM/PSN). The Hu antigens HuD, HuC, and Hel-N1 (OMIM Ref. No. 601673) each contain 2 tandemly arranged RRM connected to a third RRM by a highly basic segment. Abe et al. (1996) cloned cDNAs encoding mouse HuC. The predicted mouse and human proteins are 96% identical. These authors found that alternative splicing generates 2 mouse HuC isoforms, both of which can bind to AU-rich elements (AREs) within the 3-prime untranslated regions of mRNAs. Functional do-

main mapping using mouse HuC deletion mutants showed that the first RRM binds to ARE, that the second RRM has no binding activity by itself but facilitates ARE binding by the first RRM, and that the third RRM has specific binding activity for the poly(A) sequence. By fluorescence in situ hybridization (FISH), Van Tine et al. (1998) mapped the ELAVL3 gene to 19p13.2. Using FISH and radiation hybrid analysis, they demonstrated that ELAVL3 is centromeric to the ELAVL1 (HuR; 603466) gene located in the same chromosomal region. By analysis of an interspecific backcross, Fletcher et al. (1997) mapped the mouse HuC gene to chromosome 9, in a region showing homology of synteny to human chromosome 19p13.2.

[33481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33482] Sakai, K.; Gofuku, M.; Kitagawa, Y.; Ogasawara, T.; Hirose, G.; Yamazaki, M.; Koh, C.-S.; Yanagisawa, N.; Steinman, L. : A hippocampal protein associated with paraneoplastic neurologic syndrome and small cell lung carcinoma. Biochem. Biophys. Res. Commun. 199: 1200–1208, 1994.  
; and

[33483] Van Tine, B. A.; Knops, J. F.; Butler, A.; Deloukas, P.; Shaw,

G. M.; King, P. H. : Localization of HuC (ELAVL3) to chromosome 19p13.2 by fluorescence in situ hybridization utilizing a n.

[33484] Further studies establishing the function and utilities of ELAVL3 are found in John Hopkins OMIM database record ID 603458, and in cited publications numbered 598 and 5833–5835 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877) is another VGAM883 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6566, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33485] Another function of VGAM883 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM883

include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM704.LIM Homeobox Protein 5 (LHX5, Accession NM\_022363) is another VGAM883 host target gene. LHX5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LHX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX5 BINDING SITE, designated SEQ ID:22750, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33486] Another function of VGAM883 is therefore inhibition of LIM Homeobox Protein 5 (LHX5, Accession NM\_022363). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX5. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM\_012326) is another VGAM883 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14712, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33487] Another function of VGAM883 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM\_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.V-rel Reticuloendotheliosis Viral Oncogene Homolog A, Nuclear Factor of Kappa Light Polypeptide Gene Enhancer In B-cells 3, P65 (avian) (RELA, Accession NM\_021975) is another VGAM883 host target gene. RELA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RELA, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELA BINDING SITE, designated SEQ ID:22500, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33488] Another function of VGAM883 is therefore inhibition of V-rel Reticuloendotheliosis Viral Oncogene Homolog A, Nuclear Factor of Kappa Light Polypeptide Gene Enhancer In B-cells 3, P65 (avian) (RELA, Accession NM\_021975), a gene which has a DNA-binding domain and regulates transcription as a heterodimer with NFKB1. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELA. The function of RELA has been established by previous studies. Jacobs and Harrison (1998) and Huxford et al. (1998) determined the structure of the NFKBIA ankyrin repeat domain, bound to a partially truncated NFKB heterodimer (p50/p65), by x-ray crystallography at 2.7- and 2.3-angstrom resolution, respectively. It shows a stack of 6 NFKBIA ankyrin repeats facing the C-terminal domains of the NFKB rel homology regions. Contacts occur in discontinuous patches, suggesting a combinatorial

quality for ankyrin repeat specificity. The first 2 repeats cover an alpha helically ordered segment containing the p65 nuclear localization signal. The position of the sixth ankyrin repeat shows that full-length NFKBIA will occlude the NFKB DNA-binding cleft. The orientation of NFKBIA in the complex places its N- and C-terminal regions in appropriate locations for their known regulatory functions. Baeuerle (1998) discussed the model of interactions between NFKBIA and NFKB. Animal model experiments lend further support to the function of RELA. Neurath et al. (1996) reported direct evidence for the involvement of p65 in chronic intestinal inflammation induced in mice and suggested a potential molecular therapeutic approach to the treatment of patients with Crohn disease (OMIM Ref. No. 266600) using p65 antisense oligonucleotides.

[33489] It is appreciated that the abovementioned animal model for RELA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[33490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33491] Baeuerle, P. A. : I-kappa-B--NF-kappa-B structures: at

the interface of inflammation control. Cell 95: 729–731, 1998. ; and

[33492] Neurath, M. F.; Pettersson, S.; Myer zum Buschenfelde, K.–H.; Strober, W. : Local administration of antisense phosphorothioate oligonucleotides to the p65 subunit of NF–kappa–B abrogate.

[33493] Further studies establishing the function and utilities of RELA are found in John Hopkins OMIM database record ID 164014, and in cited publications numbered 2244–1714, 3984–1716, 2245, 1273 and 12741 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 5 (sodium iodide symporter), Member 5 (SLC5A5, Accession NM\_000453) is another VGAM883 host target gene. SLC5A5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC5A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A5 BINDING SITE, designated SEQ ID:6068, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33494] Another function of VGAM883 is therefore inhibition of

Solute Carrier Family 5 (sodium iodide symporter), Member 5 (SLC5A5, Accession NM\_000453). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A5. Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629) is another VGAM883 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12148, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33495] Another function of VGAM883 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. Cyclin M3 (CNNM3, Accession NM\_017623) is another VGAM883 host target gene.

CNNM3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNNM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM3 BINDING SITE, designated SEQ ID:19123, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33496] Another function of VGAM883 is therefore inhibition of Cyclin M3 (CNNM3, Accession NM\_017623). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM3. DKFZp761F2014 (Accession NM\_020215) is another VGAM883 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21459, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3594.

[33497] Another function of VGAM883 is therefore inhibition of DKFZp761F2014 (Accession NM\_020215). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. ELL2 (Accession NM\_012081) is another VGAM883 host target gene. ELL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL2 BINDING SITE, designated SEQ ID:14367, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33498] Another function of VGAM883 is therefore inhibition of ELL2 (Accession NM\_012081). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL2. FLJ10315 (Accession NM\_018056) is another VGAM883 host target gene. FLJ10315 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10315, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10315 BINDING SITE, designated SEQ ID:19818, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33499] Another function of VGAM883 is therefore inhibition of FLJ10315 (Accession NM\_018056). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10315. FLJ32865 (Accession NM\_144613) is another VGAM883 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29427, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33500] Another function of VGAM883 is therefore inhibition of FLJ32865 (Accession NM\_144613). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ32865. Integrin, Alpha 10 (ITGA10, Accession XM\_002097) is another VGAM883 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29860, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33501] Another function of VGAM883 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM\_002097). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA10. KIAA0211 (Accession NM\_014630) is another VGAM883 host target gene. KIAA0211 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0211 BINDING SITE, designated SEQ ID:15992, to the

nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33502] Another function of VGAM883 is therefore inhibition of KIAA0211 (Accession NM\_014630). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0211. KIAA0552 (Accession NM\_014731) is another VGAM883 host target gene. KIAA0552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0552 BINDING SITE, designated SEQ ID:16344, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33503] Another function of VGAM883 is therefore inhibition of KIAA0552 (Accession NM\_014731). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0552. KIAA1111 (Accession XM\_171233) is another VGAM883 host target gene. KIAA1111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1111 BINDING SITE, designated SEQ ID:46020, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33504] Another function of VGAM883 is therefore inhibition of KIAA1111 (Accession XM\_171233). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1111. KIAA1196 (Accession XM\_028968) is another VGAM883 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30817, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33505] Another function of VGAM883 is therefore inhibition of KIAA1196 (Accession XM\_028968). Accordingly, utilities

of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. KIAA1750 (Accession XM\_043067) is another VGAM883 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33874, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33506] Another function of VGAM883 is therefore inhibition of KIAA1750 (Accession XM\_043067). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1755 (Accession XM\_028810) is another VGAM883 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1755 BINDING SITE, designated SEQ ID:30750, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33507] Another function of VGAM883 is therefore inhibition of KIAA1755 (Accession XM\_028810). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. KIAA1910 (Accession XM\_055514) is another VGAM883 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36287, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33508] Another function of VGAM883 is therefore inhibition of KIAA1910 (Accession XM\_055514). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735) is another VGAM883

host target gene. LRRFIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRRFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP1 BINDING SITE, designated SEQ ID:11119, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33509] Another function of VGAM883 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP1. MFN2 (Accession NM\_014874) is another VGAM883 host target gene. MFN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFN2 BINDING SITE, designated SEQ ID:17010, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33510] Another function of VGAM883 is therefore inhibition of MFN2 (Accession NM\_014874). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN2. MGC20255 (Accession NM\_052848) is another VGAM883 host target gene. MGC20255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20255 BINDING SITE, designated SEQ ID:27428, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33511] Another function of VGAM883 is therefore inhibition of MGC20255 (Accession NM\_052848). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20255. Neuritin 1 (NRN1, Accession NM\_016588) is another VGAM883 host target gene. NRN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRN1 BINDING SITE, designated SEQ ID:18663, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33512] Another function of VGAM883 is therefore inhibition of Neuritin 1 (NRN1, Accession NM\_016588). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRN1. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1A (PPP1R1A, Accession NM\_006741) is another VGAM883 host target gene. PPP1R1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R1A BINDING SITE, designated SEQ ID:13591, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33513] Another function of VGAM883 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1A (PPP1R1A, Accession NM\_006741). Accordingly, utilities of

VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1A. RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979) is another VGAM883 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41279, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33514] Another function of VGAM883 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. LOC116113 (Accession XM\_166413) is another VGAM883 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44285, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33515] Another function of VGAM883 is therefore inhibition of LOC116113 (Accession XM\_166413). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC146488 (Accession XM\_047748) is another VGAM883 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35044, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33516] Another function of VGAM883 is therefore inhibition of LOC146488 (Accession XM\_047748). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC149577 (Accession XM\_097675) is an-

other VGAM883 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41022, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33517] Another function of VGAM883 is therefore inhibition of LOC149577 (Accession XM\_097675). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577. LOC158310 (Accession XM\_098919) is another VGAM883 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41949, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33518] Another function of VGAM883 is therefore inhibition of LOC158310 (Accession XM\_098919). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC196500 (Accession XM\_113734) is another VGAM883 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42389, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33519] Another function of VGAM883 is therefore inhibition of LOC196500 (Accession XM\_113734). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC201475 (Accession XM\_113967) is another VGAM883 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:42578, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33520] Another function of VGAM883 is therefore inhibition of LOC201475 (Accession XM\_113967). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. LOC253216 (Accession XM\_170765) is another VGAM883 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45519, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33521] Another function of VGAM883 is therefore inhibition of LOC253216 (Accession XM\_170765). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253216. LOC253868 (Accession XM\_170975) is another VGAM883 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45747, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33522] Another function of VGAM883 is therefore inhibition of LOC253868 (Accession XM\_170975). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. LOC90019 (Accession NM\_138567) is another VGAM883 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90019 BINDING SITE, designated SEQ ID:28871, to the nucleotide sequence of VGAM883 RNA, herein designated

VGAM RNA, also designated SEQ ID:3594.

[33523] Another function of VGAM883 is therefore inhibition of LOC90019 (Accession NM\_138567). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. LOC91397 (Accession XM\_038219) is another VGAM883 host target gene. LOC91397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91397 BINDING SITE, designated SEQ ID:32782, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33524] Another function of VGAM883 is therefore inhibition of LOC91397 (Accession XM\_038219). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91397. LOC95702 (Accession XM\_031446) is another VGAM883 host target gene. LOC95702 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC95702, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC95702 BINDING SITE, designated SEQ ID:31382, to the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, also designated SEQ ID:3594.

[33525] Another function of VGAM883 is therefore inhibition of LOC95702 (Accession XM\_031446). Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC95702. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 884 (VGAM884) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33526] VGAM884 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM884 was detected is described hereinabove with reference to Figs. 1–8.

[33527] VGAM884 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus.

VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33528] VGAM884 gene encodes a VGAM884 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM884 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM884 precursor RNA is designated SEQ ID:870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:870 is located at position 93181 relative to the genome of Rat Cytomegalovirus.

[33529] VGAM884 precursor RNA folds onto itself, forming VGAM884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33530] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM884 folded precursor RNA into VGAM884 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM884 RNA is designated SEQ ID:3595, and is provided hereinbelow with reference to the sequence listing part.

[33531] VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM884 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33532] VGAM884 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM884 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM884 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[33533] The complementary binding of VGAM884 RNA, herein designated VGAM RNA, to host target binding sites on VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM884 host target RNA into VGAM884 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33534] It is appreciated that VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM884 host target genes. The mRNA of each one of this plurality of VGAM884 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM884 RNA, herein designated VGAM RNA, and which when bound by VGAM884 RNA causes inhibition of translation of respective one or more VGAM884 host target proteins.

[33535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM884 gene, herein designated VGAM GENE, on one or more VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33536] It is yet further appreciated that a function of VGAM884 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM884 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM884 correlate with, and may be deduced from, the identity of the host target genes which VGAM884 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33537] Nucleotide sequences of the VGAM884 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM884 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM884 are further described hereinbelow with reference to Table 1.

[33538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM884 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM884 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM884 gene, herein designated VGAM is inhibition of expression of VGAM884 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM884 correlate with, and may be deduced from, the identity of the target genes which VGAM884 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33540] Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM\_002745) is a VGAM884 host target gene. MAPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK1 BINDING SITE, designated SEQ ID:8617, to the

nucleotide sequence of VGAM884 RNA, herein designated VGAM RNA, also designated SEQ ID:3595.

[33541] A function of VGAM884 is therefore inhibition of Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM\_002745), a gene which phosphorylates microtubule-associated protein-2 (map2). myelin basic protein (mbp), and elk-1; may promote entry in the cell cycle. Accordingly, utilities of VGAM884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK1. The function of MAPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.LOC126302 (Accession XM\_059020) is another VGAM884 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36825, to the nucleotide sequence of VGAM884 RNA, herein designated VGAM RNA, also designated SEQ ID:3595.

[33542] Another function of VGAM884 is therefore inhibition of LOC126302 (Accession XM\_059020). Accordingly, utilities of VGAM884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC51277 (Accession XM\_087054) is another VGAM884 host target gene. LOC51277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51277 BINDING SITE, designated SEQ ID:39023, to the nucleotide sequence of VGAM884 RNA, herein designated VGAM RNA, also designated SEQ ID:3595.

[33543] Another function of VGAM884 is therefore inhibition of LOC51277 (Accession XM\_087054). Accordingly, utilities of VGAM884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51277. LOC56965 (Accession NM\_020213) is another VGAM884 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21450, to the nucleotide sequence of VGAM884 RNA, herein designated VGAM RNA, also designated SEQ ID:3595.

[33544] Another function of VGAM884 is therefore inhibition of LOC56965 (Accession NM\_020213). Accordingly, utilities of VGAM884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 885 (VGAM885) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33545] VGAM885 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM885 was detected is described hereinabove with reference to Figs. 1–8.

[33546] VGAM885 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM885 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[33547] VGAM885 gene encodes a VGAM885 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM885 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM885 precursor RNA is designated SEQ ID:871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:871 is located at position 7211 relative to the genome of Human Adenovirus E.

[33548] VGAM885 precursor RNA folds onto itself, forming VGAM885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33549] An enzyme complex designated DICER COMPLEX, `dices` the VGAM885 folded precursor RNA into VGAM885 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM885 RNA is designated SEQ ID:3596, and is provided hereinbelow with reference to the sequence listing part.

[33550] VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM885 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33551] VGAM885 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM885 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM885 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33552] The complementary binding of VGAM885 RNA, herein designated VGAM RNA, to host target binding sites on VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM885 host target RNA into VGAM885 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[33553] It is appreciated that VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM885 host target genes. The mRNA of each one of this plurality of VGAM885 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM885 RNA, herein designated VGAM RNA, and which when bound by VGAM885 RNA causes inhibition of translation of respective one or more VGAM885 host target proteins.

[33554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM885 gene, herein designated VGAM GENE, on one or more VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33555] It is yet further appreciated that a function of VGAM885 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM885 correlate with, and may be deduced from, the identity of the host target genes which VGAM885 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33556] Nucleotide sequences of the VGAM885 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM885 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM885 are further described hereinbelow with reference to Table 1.

[33557] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM885 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM885 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33558] As mentioned hereinabove with reference to Fig. 1, a function of VGAM885 gene, herein designated VGAM is inhibition of expression of VGAM885 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM885 correlate with, and may be deduced from, the identity of the target genes which VGAM885 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33559] Alkaline Phosphatase, Intestinal (ALPI, Accession NM\_001631) is a VGAM885 host target gene. ALPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPI BINDING SITE, designated SEQ ID:7344, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM

RNA, also designated SEQ ID:3596.

[33560] A function of VGAM885 is therefore inhibition of Alkaline Phosphatase, Intestinal (ALPI, Accession NM\_001631), a gene which is a glycoprotein phosphatase. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPI. The function of ALPI has been established by previous studies. Harris et al. (1974) found no genetic variants by electrophoretic means. Lehmann (1980) provided biochemical corroboration of the genetic distinctness of 3 alkaline phosphatases: intestinal, placental, and liver/bone/kidney. The existence of at least 1 gene coding for the intestinal forms (adult and fetal), independent of the other forms listed here, is inescapable (Goldstein et al., 1980). Gogolin et al. (1982) found a monoclonal antibody raised against purified human placental alkaline phosphatase that crossreacted with the adult and fetal forms of intestinal alkaline phosphatase, despite the fact that the placental and intestinal enzymes are nonallelic. Berger et al. (1987) used alkaline phosphatase cDNA as a probe to clone intestinal alkaline phosphatase cDNA, since partial protein sequence data indicated a high degree of homology between intestinal alkaline phosphatase and the

reported sequence of the placental isoenzyme. Intestinal alkaline phosphatase cDNA, which is 3.1 kb, is somewhat larger than the cDNA for the placental isoenzyme, which is 2.8 kb. Differences and similarities were pointed out.

Henthorn et al. (1987) isolated and sequenced a cDNA that encodes the alkaline phosphatase expressed in adult human intestine and compared the sequence with those previously determined for the placental (OMIM Ref. No. 171800) and liver/bone/kidney (OMIM Ref. No. 171760) cDNAs. The deduced polypeptide showed 86.5% amino acid identity to placental ALP and 56.6% amino acid identity to liver/bone/kidney ALP. Thus, the immunologic cross-reactivity of ALPI and ALPP is perhaps explained.

Henthorn et al. (1988) isolated and sequenced the ALPI gene in its entirety. The gene is composed of 11 exons interrupted by 10 introns. Introns in intestinal, placental, and liver/bone/kidney ALP genes occur at analogous positions, confirming that these genes arose from a single ancestral gene. Henthorn et al. (1987) stated that the placental and intestinal ALP genes map to the same region of chromosome 2. Griffin et al. (1987) mapped both the placental and the intestinal alkaline phosphatase genes to 2q34–q37 by chromosomal in situ hybridization and hy-

bridization to the DNA of somatic cell hybrids. By fluorescence in situ hybridization, Wu et al. (1993) mapped ALPI to 2q36.3–q37.1. Pasteris et al. (1993) concluded from a molecular analysis of a chromosome 2 deletion mapping panel that the ALPI gene is on the telomeric side of both PAX3 (OMIM Ref. No. 606597) and COL4A3 (OMIM Ref. No. 120070) and close to CHRND (OMIM Ref. No. 100720).

[33561] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33562] Henthorn, P. S.; Raducha, M.; Edwards, Y. H.; Weiss, M. J.; Slaughter, C.; Lafferty, M. A.; Harris, H. : Nucleotide and amino acid sequences of human intestinal alkaline phosphatase: close homology to placental alkaline phosphatase. Proc. Nat. Acad. Sci. 84: 1234–1238, 1987. ; and

[33563] Langman, M. J. S.; Leuthold, E.; Robson, E. B.; Harris, J.; Luffman, J. E.; Harris, H. : Influence of diet on the 'intestinal' component of serum alkaline phosphatase in people of differ.

[33564] Further studies establishing the function and utilities of ALPI are found in John Hopkins OMIM database record ID 171740, and in cited publications numbered 10, 2495–2498, 1886, 2499–250 and 4112 listed in the bibli–

ography section hereinbelow, which are also hereby incorporated by reference. Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167) is another VGAM885 host target gene. ARHC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHC BINDING SITE, designated SEQ ID:11664, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33565] Another function of VGAM885 is therefore inhibition of Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167), a gene which remodels of the actin cytoskeleton during cell morphogenesis and motility. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHC. The function of ARHC has been established by previous studies. The small guanosine triphosphatase Rho regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. In their Figure 3C, Maekawa et al. (1999) diagrammed pro-

posed signaling pathways for Rho-induced remodeling of the actin cytoskeleton. They demonstrated that active Rho signals to its downstream effector ROCK (OMIM Ref. No. 601702), which phosphorylates and activates LIM kinase (see OMIM Ref. No. 601329). LIM kinase, in turn, phosphorylates cofilin (OMIM Ref. No. 601442), inhibiting its actin-depolymerizing activity. Clark et al. (2000) used an in vivo selection scheme to select highly metastatic melanoma cells. By analyzing these cells on DNA arrays, they defined a pattern of gene expression that correlates with progression to a metastatic phenotype. In particular, Clark et al. (2000) showed enhanced expression of several genes involved in extracellular matrix assembly and of a second set of genes that regulate, either directly or indirectly, the actin-based cytoskeleton. Clark et al. (2000) found that RhoC enhances metastasis when overexpressed, whereas a dominant-negative Rho inhibits metastasis. Analysis of the phenotype of cells expressing dominant-negative Rho or RhoC indicates that RhoC is important in tumor cell invasion. The genomic approach allowed Clark et al. (2000) to identify families of genes involved in a process, not just single genes, and could indicate which molecular and cellular events might be impor-

tant in complex biologic processes such as metastasis.

[33566] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33567] Clark, E. A.; Golub, T. R.; Lander, E. S.; Hynes, R. O. : Genomic analysis of metastasis reveals an essential role for RhoC. Nature 406: 532–535, 2000. ; and

[33569] Further studies establishing the function and utilities of ARHC are found in John Hopkins OMIM database record ID 165380, and in cited publications numbered 10904–10905, 2155, 10909–1090 and 10910 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BLTR2 (Accession NM\_019839) is another VGAM885 host target gene. BLTR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BLTR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of BLTR2 BINDING SITE, designated SEQ ID:21244, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33570] Another function of VGAM885 is therefore inhibition of BLTR2 (Accession NM\_019839). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLTR2. Calpain 10 (CAPN10, Accession NM\_023084) is another VGAM885 host target gene. CAPN10 BINDING SITE1 through CAPN10 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CAPN10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN10 BINDING SITE1 through CAPN10 BINDING SITE4, designated SEQ ID:23347, SEQ ID:23349, SEQ ID:23351 and SEQ ID:23353 respectively, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33571] Another function of VGAM885 is therefore inhibition of Calpain 10 (CAPN10, Accession NM\_023084), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal transduction. Ac-

cordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Cell Division Cycle 2-like 2 (CDC2L2, Accession NM\_033532) is another VGAM885 host target gene. CDC2L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDC2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE, designated SEQ ID:27301, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33572] Another function of VGAM885 is therefore inhibition of Cell Division Cycle 2-like 2 (CDC2L2, Accession NM\_033532). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC2L2. Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730) is another VGAM885 host target gene. DNASE1L1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNASE1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ ID:13567, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33573] Another function of VGAM885 is therefore inhibition of Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1L1. The function of DNASE1L1 has been established by previous studies. Parrish et al. (1995) isolated a novel cDNA from the region of Xq28 between QM (OMIM Ref. No. 312173) and DXS1010E. Sequence similarity to DNase I (OMIM Ref. No. 125505) was high at the DNA and peptide sequence levels. The transcript was present at highest levels in skeletal and cardiac muscle, with lower expression in other tissues. Mutation analysis was performed using DNA samples from 2 unrelated patients with Barth syndrome (OMIM

Ref. No. 302060) and from 11 unrelated patients with Emery–Dreifuss muscular dystrophy (OMIM Ref. No. 310300), 2 genetic disorders involving muscle and with joint linkage to Xq28. No disease-associated mutations were detected in the coding region of the gene; however, Parrish et al. (1995) found a novel 190-bp insertion/deletion polymorphism in the 3-prime untranslated region. Translation of the long open reading frame found in the cDNA yielded a putative 302-amino acid protein with 37.6% identity to human DNase I. The protein was predicted to contain a signal sequence at the amino terminus, a transmembrane domain near the carboxyl terminus, and a helix–loop–helix domain. Pergolizzi et al. (1996) screened cDNA libraries with a cosmid that had been mapped to Xq28 in the region between RCP/GCP (303900; 303800) and G6PD (OMIM Ref. No. 305900). They obtained a 2.1-kb cDNA and showed that it encodes a putative 302-amino acid protein with 44% sequence identity to pig DNase I and 39% identity to human DNase I. Northern blots showed a single 2.0-kb transcript in adult heart and skeletal muscle and an additional transcript of 2.5 kb in some fetal tissues. (The sequence of Pergolizzi et al. (1996) was identical to that reported by Parrish et al.

(1995)).

[33574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33575] Parrish, J. E.; Ciccodicola, A.; Wehnert, M.; Cox, G. F.; Chen, E.; Nelson, D. L. : A muscle-specific DNase I-like gene in human Xq28. Hum. Molec. Genet. 4: 1557–1564, 1995. ; and

[33576] Pergolizzi, R.; Appierto, V.; Bosetti, A.; DeBellis, G. L.; Rovida, E.; Biunno, I. : Cloning of a gene encoding a DNase I-like endonuclease in the human Xq28 region. Gene 168: 267–270.

[33577] Further studies establishing the function and utilities of DNASE1L1 are found in John Hopkins OMIM database record ID 300081, and in cited publications numbered 10970–10971 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deoxyribonuclease II, Lysosomal (DNASE2, Accession NM\_001375) is another VGAM885 host target gene. DNASE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNASE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DNASE2 BINDING SITE, designated SEQ ID:7049, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33578] Another function of VGAM885 is therefore inhibition of Deoxyribonuclease II, Lysosomal (DNASE2, Accession NM\_001375), a gene which has a possible role in apoptosis. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE2. The function of DNASE2 has been established by previous studies. Yasuda et al. (1992) described a specific and highly sensitive assay for urinary and leukocytic DNASE2. In both urine and leukocytes, the enzyme showed clear-cut bimodality, and the Japanese study population could be classified into 2 distinct types, namely low-activity (DNASE2 L) and high-activity (DNASE2 H), which indicated the existence of a genetic polymorphism. Close correlations between the leukocytic and urinary enzyme activity levels from the same individuals were observed, and the types in the leukocyte samples agreed with the types found in the corresponding urine samples. In a group of 528 unrelated

Japanese individuals, the gene frequencies of the low-activity allele (DNASE2\*L) and the high-activity allele (DNASE2\*H) were calculated to be 0.632 and 0.368, respectively. Sex and age did not affect the distribution of the DNASE2 activity levels. Family studies indicated that the low-activity type is autosomal recessive. Using RACE with primers based on the sequence of purified DNase II protein to amplify thyroid RNA, Yasuda et al. (1998) cloned the DNase II gene. The predicted 360-amino acid protein has 3 parts: a 16-amino acid signal peptide, a 91-amino acid propeptide, and a 253-amino acid mature protein region. Yasuda et al. (1998) suggested that, like other lysosomal enzymes, DNase II is processed by release of a signal peptide followed by proteolytic processing that generates a 2-chain enzyme. Purified DNase II migrates as 2 bands (32 and 12 kD) on SDS-PAGE. Using RT-PCR, Yasuda et al. (1998) found that DNase II is expressed ubiquitously. Animal model experiments lend further support to the function of DNASE2. Mature erythrocytes in mammals have no nuclei, although they differentiate from nucleated precursor cells. Kawane et al. (2001) demonstrated that DNase II is indispensable for definitive erythropoiesis in mouse fetal liver. No live DNase II-null mice

were born, owing to severe anemia. When mutant fetal liver cells were transferred into lethally irradiated wildtype mice, mature red blood cells were generated from the mutant cells, suggesting that DNase II functions in a non-cell-autonomous manner. Histochemical analyses indicated that the critical cellular sources of DNase II are macrophages present at the site of definitive erythropoiesis in the fetal liver. Thus, Kawane et al. (2001) concluded that DNase II in macrophages appears to be responsible for destroying the nuclear DNA expelled from erythroid precursor cells.

[33579] It is appreciated that the abovementioned animal model for DNASE2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[33580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33581] Yasuda, T.; Nadano, D.; Sawazaki, K.; Kishi, K. : Genetic polymorphism of human deoxyribonuclease II (DNase II): low activity levels in urine and leukocytes are due to an autosomal recessive allele. *Ann. Hum. Genet.* 56: 1-10, 1992. ; and

[33582] Yasuda, T.; Takeshita, H.; Iida, R.; Nakajima, T.; Hosomi, O.; Nakashima, Y.; Kishi, K. : Molecular cloning of the cDNA encoding human deoxyribonuclease II. J. Biol. Chem. 273: 2610–261.

[33583] Further studies establishing the function and utilities of DNASE2 are found in John Hopkins OMIM database record ID 126350, and in cited publications numbered 3436–3441 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hedgehog Interacting Protein (HHIP, Accession NM\_022475) is another VGAM885 host target gene. HHIP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHIP BINDING SITE, designated SEQ ID:22842, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33584] Another function of VGAM885 is therefore inhibition of Hedgehog Interacting Protein (HHIP, Accession NM\_022475), a gene which is involved in many fundamental processes in embryonic development, including

anteroposterior patterns of limbs and regulation of left-right asymmetry. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHIP. The function of HHIP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM\_000195) is another VGAM885 host target gene. HPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS1 BINDING SITE, designated SEQ ID:5694, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33585] Another function of VGAM885 is therefore inhibition of Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM\_000195). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS1. Interferon Gamma Receptor 2 (interferon gamma transducer 1) (IFNGR2, Ac-

cession NM\_005534) is another VGAM885 host target gene. IFNGR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IFNGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNGR2 BINDING SITE, designated SEQ ID:12054, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33586] Another function of VGAM885 is therefore inhibition of Interferon Gamma Receptor 2 (interferon gamma transducer 1) (IFNGR2, Accession NM\_005534), a gene which is required for signal transduction. this accessory factor is an integral part of the ifn-gamma signal transduction pathway and is likely to interact with gaf, jak1, and/or jak2. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNGR2. The function of IFNGR2 has been established by previous studies. For the cellular response of somatic cell hybrids (from fibroblasts) to gamma-interferon (OMIM Ref. No. 147570), the gamma-interferon receptor on 6q and a factor on chromosome

21q are necessary (Jung et al., 1987). Langer et al. (1990) demonstrated that the factor encoded by chromosome 21 is separate from the alpha and beta interferon receptors (see OMIM Ref. No. 107450) but maps to the same region. In hamster–human somatic cell hybrids, the presence of the IFN–gamma receptor–related factor mediating cellular responsiveness was determined by HLA induction in hybrid cells containing the IFN–gamma receptor on 6q, a transfected copy of the human HLA–B7 gene, and various portions of chromosome 21. In all hybrids, the IFNGT1 gene cosegregated with the IFNAR gene. (Presumably OMIM Ref. No. 107470.) Bono et al. (1991) likewise mapped this gene to chromosome 21 by study of somatic cell hybrids. Soh et al. (1993) identified a small region of chromosome 21 that is responsible for encoding accessory factor(s) by study of hamster–human somatic cell hybrids carrying an irradiation–reduced fragment of human chromosome 21. To localize the genes further, 10 different YAC clones from 6 different loci in the region were fused to a human–hamster hybrid cell line that contained 6q (supplying the interferon–gamma receptor) and the human HLA–B7 gene. These transformed cells were assayed for induction of class I HLA antigens upon treat–

ment with gamma-interferon. Soh et al. (1993) described a 540-kb YAC that could substitute for chromosome 21 in functioning as the accessory factor. The factor encoded by the YAC did not confer antiviral protection against the encephalomyocarditis virus, however, demonstrating that an additional factor encoded on human chromosome 21 is required for the antiviral activity. Mariano et al. (1996) mapped the *Ifgr2* gene to the distal end of mouse chromosome 16 by the study of interspecies backcrosses. Rhee et al. (1996) found that the *IFNGR2* gene spans over 33 kb of DNA and contains 7 exons. A signal peptide is encoded by exons 1 and 2, the extracellular domain by exons 2, 3, 4, 5, and part of 6. Exon 6 also encodes the entire transmembrane domain and part of the intracellular domain. Exon 7 encodes the remainder of the intracellular domain and contains the 3-prime untranslated region. No TATA or CAAT boxes were found in the promoter region. Consistent with the lack of a TATA box, analysis of mRNAs by primer extension showed multiple transcription start sites. Mutations in the IFN-gamma receptor ligand-binding chain (*IFNGR1*; 107470) have been shown to confer susceptibility to severe infection with nontuberculous mycobacteria. Dorman and Holland (1998) described a

mutation in the IFN- $\gamma$  receptor signal-transducing chain (OMIM Ref. No. IFNGR2) in a child with disseminated *Mycobacterium fortuitum* and *M. avium* complex infections, associated with absent IFN- $\gamma$  signaling due to a mutation in the extracellular domain of IFNGR2. The patient was a male who had 2 episodes of otitis media and 1 episode of thrush, all of which responded promptly to standard treatment. He received prescribed childhood immunizations but did not receive BCG vaccine. At 20 months of age, he developed a cough with pulmonary infiltrates that did not resolve with antibiotics. At 2 years of age, he developed lymphadenopathy, hepatosplenomegaly, and fevers. Biopsy of an axillary lymph node showed capsular fibrosis and histiocytic infiltration without abscesses or granulomata. Acid-fast bacilli were present on staining, and cultures grew the 2 forms of mycobacterium mentioned. Intensive therapy failed to eliminate the infection. The mother was of English descent and the father of English and Portuguese descent; they were not known to be related. A maternal aunt had been diagnosed with tuberculosis at age 3 years and subsequently developed cervical lymphadenopathy; she died at the age of 26 years of chronic aggressive hepatitis. In vitro cy-

tokine production by the patient's peripheral blood mononuclear cells showed 75% less PHA-induced interferon-gamma production than in normal cells, while the patient's PHA-induced TNF-alpha production was normal.

[33587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33588] Rhee, S.; Ebensperger, C.; Dembic, Z.; Pestka, S. : The structure of the gene for the second chain of the human interferon-gamma receptor. J. Biol. Chem. 271: 28947-28952, 1996. ; and

[33589] Dorman, S. E.; Holland, S. M. : Mutation in the signal-transducing chain of the interferon-gamma receptor and susceptibility to mycobacterial infection. J. Clin. Invest. 101: 2364-2369.

[33590] Further studies establishing the function and utilities of IFNGR2 are found in John Hopkins OMIM database record ID 147569, and in cited publications numbered 2733-2740 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM\_002332) is another VGAM885 host target gene. LRP1 BINDING SITE is HOST

TARGET binding site found in the 5' untranslated region of mRNA encoded by LRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1 BINDING SITE, designated SEQ ID:8137, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33591] Another function of VGAM885 is therefore inhibition of Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM\_002332), a gene which is a recycling lipoprotein receptor with possible growth-modulating effects. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1. The function of LRP1 has been established by previous studies. Herz et al. (1988) cloned a cDNA for the low density lipoprotein receptor-related protein (LRP) by virtue of its close homology to the LDL receptor (OMIM Ref. No. 606945). Kristensen et al. (1990) and Strickland et al. (1990) demonstrated that LRP is identical to the alpha-2-macroglobulin (A2M; 103950) receptor (A2MR). Like the mannose-6-phosphate receptor (OMIM Ref. No.

147280), the A2MR/LRP molecule is probably bifunctional. The heat-shock protein gp96 (TRA1; 191175) is an intracellular protein capable of chaperoning exogenous antigens from tumors or virus-infected cells to antigen-presenting cells for presentation through major histocompatibility complex (MHC) class I rather than class II molecules, thereby eliciting CD8 (OMIM Ref. No. 186910)-positive T-cell responses. Using a mouse system, Binder et al. (2000) determined that the receptor for gp96 is CD91 (A2MR) and that A2M, a protein found in blood, inhibits gp96 binding to CD91. They proposed that CD91 acts as a sensor for necrotic cell death in tissues, leading to proinflammatory immune responses.

[33592] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33593] Strickland, D. K.; Ashcom, J. D.; Williams, S.; Burgess, W. H.; Migliorini, M.; Argraves, W. S. : Sequence identity between the alpha-2-macroglobulin receptor and low density lipoprotein receptor-related protein suggests that this molecule is a multifunctional receptor. J. Biol. Chem. 265: 17401-17404, 1990. ; and

[33594] Binder, R. J.; Han, D. K.; Srivastava, P. K. : CD91: a recep-

tor for heat shock protein gp96. Nature Immun. 1: 151–155, 2000.

[33595] Further studies establishing the function and utilities of LRP1 are found in John Hopkins OMIM database record ID 107770, and in cited publications numbered 12057–12061, 831, 12062–1206 and 12070–12068 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Transcription Factor Y, Gamma (NFYC, Accession NM\_014223) is another VGAM885 host target gene. NFYC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFYC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFYC BINDING SITE, designated SEQ ID:15494, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33596] Another function of VGAM885 is therefore inhibition of Nuclear Transcription Factor Y, Gamma (NFYC, Accession NM\_014223). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFYC. PACE (Accession

NM\_002569) is another VGAM885 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8427, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33597] Another function of VGAM885 is therefore inhibition of PACE (Accession NM\_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424) is another VGAM885 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44316, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33598] Another function of VGAM885 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. Paired Box Gene 8 (PAX8, Accession NM\_013953) is another VGAM885 host target gene. PAX8 BINDING SITE1 through PAX8 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX8 BINDING SITE1 through PAX8 BINDING SITE3, designated SEQ ID:15136, SEQ ID:15177 and SEQ ID:15135 respectively, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33599] Another function of VGAM885 is therefore inhibition of Paired Box Gene 8 (PAX8, Accession NM\_013953), a gene which maintains the functional differentiation of thyroid cell type. Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX8. The function of PAX8 has been established by previous studies. Pasca di Magliano et al. (2000) demonstrated that PAX8 is sufficient to activate expression of endogenous genes encoding thyroglobulin (TG; 188450), thyroperoxidase (TPO; 274500), and sodium/iodide symporter (SLC5A5; 601843), all thyroid-specific genes. The cell system they used provided direct evidence for the ability of PAX8 to activate transcription of thyroid-specific genes at their chromosomal locus and strongly suggested a fundamental role of this transcription factor in the maintenance of functional differentiation in thyroid cells. Moreover, they showed that PAX8 and thyroid transcription factor-1 (OMIM Ref. No. 600635) cooperate in the activation of the thyroglobulin promoter. Animal model experiments lend further support to the function of PAX8. The thyroid gland develops from 2 distinct embryonic lineages: follicular cells, which produce thyroxine and are of endodermal ori-

gin, and parafollicular C-cells, which produce calcitonin and are of neural crest origin. Mice lacking thyroid transcription factor-1 (OMIM Ref. No. 600635) lack both cell types and thus are unable to develop a thyroid gland. By analysis of Pax8 knockout mice (Pax8  $-/-$ ), Mansouri et al. (1998) demonstrated that Pax8 is required for the formation of the follicular cells in the thyroid. They presented evidence that Pax8 is necessary for providing cues for the differentiation of component endoderm primordia into thyroxine-producing follicular cells.

[33600] It is appreciated that the abovementioned animal model for PAX8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[33601] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33602] Pasca di Magliano, M.; Di Lauro, R.; Zannini, M. : Pax8 has a key role in thyroid cell differentiation. Proc. Nat. Acad. Sci. 97: 13144–13149, 2000. ; and

[33603] Mansouri, A.; Chowdhury, K.; Gruss, P. : Follicular cells of the thyroid gland require Pax8 gene function. Nature Genet. 19: 87–90, 1998.

[33604] Further studies establishing the function and utilities of PAX8 are found in John Hopkins OMIM database record ID 167415, and in cited publications numbered 10774–10777, 10760, 10778, 10779, 10780, 1094 and 10947–10948 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422) is another VGAM885 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28644, SEQ ID:28653 and SEQ ID:28662 respectively, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33605] Another function of VGAM885 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Baculoviral IAP Re-

peat-containing 8 (BIRC8, Accession NM\_033341) is another VGAM885 host target gene. BIRC8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC8 BINDING SITE, designated SEQ ID:27196, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33606] Another function of VGAM885 is therefore inhibition of Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM\_033341). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC8. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM\_016605) is another VGAM885 host target gene. C5orf6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18705, to the nucleotide se-

quence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33607] Another function of VGAM885 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM\_016605). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. Cullin 2 (CUL2, Accession NM\_003591) is another VGAM885 host target gene. CUL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CUL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL2 BINDING SITE, designated SEQ ID:9647, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33608] Another function of VGAM885 is therefore inhibition of Cullin 2 (CUL2, Accession NM\_003591). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL2. DKFZP434J037 (Accession NM\_030952) is another VGAM885 host target gene. DKFZP434J037 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DKFZP434J037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J037 BINDING SITE, designated SEQ ID:25219, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33609] Another function of VGAM885 is therefore inhibition of DKFZP434J037 (Accession NM\_030952). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J037. DKFZP564C1940 (Accession NM\_014045) is another VGAM885 host target gene. DKFZP564C1940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564C1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C1940 BINDING SITE, designated SEQ ID:15273, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33610] Another function of VGAM885 is therefore inhibition of

DKFZP564C1940 (Accession NM\_014045). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C1940. DKFZp762A227 (Accession NM\_017611) is another VGAM885 host target gene. DKFZp762A227 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp762A227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE, designated SEQ ID:19107, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33611] Another function of VGAM885 is therefore inhibition of DKFZp762A227 (Accession NM\_017611). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. EFS2 (Accession NM\_005864) is another VGAM885 host target gene. EFS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFS2 BINDING SITE, designated SEQ ID:12478, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33612] Another function of VGAM885 is therefore inhibition of EFS2 (Accession NM\_005864). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFS2. Four Jointed Box 1 (Drosophila) (FJX1, Accession NM\_014344) is another VGAM885 host target gene. FJX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FJX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FJX1 BINDING SITE, designated SEQ ID:15663, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33613] Another function of VGAM885 is therefore inhibition of Four Jointed Box 1 (Drosophila) (FJX1, Accession NM\_014344). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with FJX1. FLJ10898 (Accession XM\_002486) is another VGAM885 host target gene.

FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29891, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33614] Another function of VGAM885 is therefore inhibition of FLJ10898 (Accession XM\_002486). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. FLJ21709 (Accession XM\_085480) is another VGAM885 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38170, to the nucleotide sequence of

VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33615] Another function of VGAM885 is therefore inhibition of FLJ21709 (Accession XM\_085480). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. FLJ23476 (Accession NM\_024640) is another VGAM885 host target gene. FLJ23476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23476 BINDING SITE, designated SEQ ID:23921, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33616] Another function of VGAM885 is therefore inhibition of FLJ23476 (Accession NM\_024640). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23476. Insulin-like Growth Factor 2, Antisense (IGF2AS, Accession NM\_016412) is another VGAM885 host target gene. IGF2AS BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by IGF2AS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2AS BINDING SITE, designated SEQ ID:18540, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33617] Another function of VGAM885 is therefore inhibition of Insulin-like Growth Factor 2, Antisense (IGF2AS, Accession NM\_016412). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2AS. Integrin, Beta 8 (ITGB8, Accession NM\_002214) is another VGAM885 host target gene. ITGB8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGB8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB8 BINDING SITE, designated SEQ ID:7978, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33618] Another function of VGAM885 is therefore inhibition of Integrin, Beta 8 (ITGB8, Accession NM\_002214). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB8. KIAA0255 (Accession NM\_014742) is another VGAM885 host target gene. KIAA0255 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0255 BINDING SITE, designated SEQ ID:16416, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33619] Another function of VGAM885 is therefore inhibition of KIAA0255 (Accession NM\_014742). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. KIAA0275 (Accession NM\_014767) is another VGAM885 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE, designated SEQ ID:16553, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33620] Another function of VGAM885 is therefore inhibition of KIAA0275 (Accession NM\_014767). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0275. KIAA0514 (Accession NM\_014696) is another VGAM885 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16209, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33621] Another function of VGAM885 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0514. KIAA0601 (Accession XM\_031267) is another VGAM885 host target gene. KIAA0601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0601 BINDING SITE, designated SEQ ID:31327, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33622] Another function of VGAM885 is therefore inhibition of KIAA0601 (Accession XM\_031267). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0601. KIAA0769 (Accession NM\_014824) is another VGAM885 host target gene. KIAA0769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0769 BINDING SITE, designated SEQ ID:16802, to the nucleotide sequence of VGAM885 RNA, herein designated

VGAM RNA, also designated SEQ ID:3596.

[33623] Another function of VGAM885 is therefore inhibition of KIAA0769 (Accession NM\_014824). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0769. KIAA0945 (Accession NM\_014952) is another VGAM885 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17296, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33624] Another function of VGAM885 is therefore inhibition of KIAA0945 (Accession NM\_014952). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. KIAA1161 (Accession XM\_088501) is another VGAM885 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39752, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33625] Another function of VGAM885 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1908 (Accession XM\_055834) is another VGAM885 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36335, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33626] Another function of VGAM885 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1908. Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM\_033392) is another VGAM885 host target gene. MAPK8IP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK8IP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP3 BINDING SITE, designated SEQ ID:27220, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33627] Another function of VGAM885 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM\_033392). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP3. MGC4172 (Accession NM\_024308) is another VGAM885 host target gene. MGC4172 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC4172 BINDING SITE, designated SEQ ID:23599, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33628] Another function of VGAM885 is therefore inhibition of MGC4172 (Accession NM\_024308). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4172. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM\_040635) is another VGAM885 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33355, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33629] Another function of VGAM885 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM\_040635). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with P2RX1. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM\_044533) is another VGAM885 host target gene. SEMA4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:34225, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33630] Another function of VGAM885 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM\_044533). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4B. Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM\_043609) is another VGAM885 host target gene. SULT4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SULT4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT4A1 BINDING SITE, designated SEQ ID:33975, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33631] Another function of VGAM885 is therefore inhibition of Sulfotransferase Family 4A, Member 1 (SULT4A1, Accession XM\_043609). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT4A1. U5-116KD (Accession NM\_004247) is another VGAM885 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:10440, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33632] Another function of VGAM885 is therefore inhibition of

U5-116KD (Accession NM\_004247). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. LOC115708 (Accession XM\_056552) is another VGAM885 host target gene. LOC115708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115708 BINDING SITE, designated SEQ ID:36406, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33633] Another function of VGAM885 is therefore inhibition of LOC115708 (Accession XM\_056552). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115708. LOC126432 (Accession XM\_059046) is another VGAM885 host target gene. LOC126432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC126432 BINDING SITE, designated SEQ ID:36840, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33634] Another function of VGAM885 is therefore inhibition of LOC126432 (Accession XM\_059046). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126432. LOC129011 (Accession XM\_059326) is another VGAM885 host target gene. LOC129011 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129011 BINDING SITE, designated SEQ ID:36965, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33635] Another function of VGAM885 is therefore inhibition of LOC129011 (Accession XM\_059326). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129011. LOC145468 (Accession XM\_057874) is an-

other VGAM885 host target gene. LOC145468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145468 BINDING SITE, designated SEQ ID:36549, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33636] Another function of VGAM885 is therefore inhibition of LOC145468 (Accession XM\_057874). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145468. LOC147072 (Accession XM\_017121) is another VGAM885 host target gene. LOC147072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147072 BINDING SITE, designated SEQ ID:30298, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33637] Another function of VGAM885 is therefore inhibition of LOC147072 (Accession XM\_017121). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147072. LOC148304 (Accession XM\_086141) is another VGAM885 host target gene. LOC148304 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148304 BINDING SITE, designated SEQ ID:38520, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33638] Another function of VGAM885 is therefore inhibition of LOC148304 (Accession XM\_086141). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148304. LOC148479 (Accession XM\_086204) is another VGAM885 host target gene. LOC148479 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148479, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148479 BINDING SITE, designated SEQ ID:38540, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33639] Another function of VGAM885 is therefore inhibition of LOC148479 (Accession XM\_086204). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148479. LOC150155 (Accession XM\_047977) is another VGAM885 host target gene. LOC150155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150155 BINDING SITE, designated SEQ ID:35091, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33640] Another function of VGAM885 is therefore inhibition of LOC150155 (Accession XM\_047977). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150155. LOC151429 (Accession XM\_098059) is another VGAM885 host target gene. LOC151429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:41342, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33641] Another function of VGAM885 is therefore inhibition of LOC151429 (Accession XM\_098059). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429. LOC152274 (Accession XM\_087418) is another VGAM885 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39231, to the nucleotide sequence of VGAM885 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3596.

[33642] Another function of VGAM885 is therefore inhibition of LOC152274 (Accession XM\_087418). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC152283 (Accession XM\_098196) is another VGAM885 host target gene. LOC152283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE, designated SEQ ID:41485, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33643] Another function of VGAM885 is therefore inhibition of LOC152283 (Accession XM\_098196). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283. LOC158056 (Accession XM\_088463) is another VGAM885 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39717, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33644] Another function of VGAM885 is therefore inhibition of LOC158056 (Accession XM\_088463). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC161190 (Accession XM\_090747) is another VGAM885 host target gene. LOC161190 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161190, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161190 BINDING SITE, designated SEQ ID:40014, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33645] Another function of VGAM885 is therefore inhibition of LOC161190 (Accession XM\_090747). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161190. LOC200853 (Accession XM\_114308) is another VGAM885 host target gene. LOC200853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200853 BINDING SITE, designated SEQ ID:42868, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33646] Another function of VGAM885 is therefore inhibition of LOC200853 (Accession XM\_114308). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200853. LOC204965 (Accession XM\_117691) is another VGAM885 host target gene. LOC204965 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204965 BINDING SITE, designated SEQ ID:43575, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33647] Another function of VGAM885 is therefore inhibition of LOC204965 (Accession XM\_117691). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204965. LOC219397 (Accession XM\_167889) is another VGAM885 host target gene. LOC219397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219397 BINDING SITE, designated SEQ ID:44900, to the nucleotide sequence of VGAM885 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3596.

[33648] Another function of VGAM885 is therefore inhibition of LOC219397 (Accession XM\_167889). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219397. LOC219654 (Accession XM\_166095) is another VGAM885 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43874, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33649] Another function of VGAM885 is therefore inhibition of LOC219654 (Accession XM\_166095). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC219920 (Accession XM\_167787) is another VGAM885 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44808, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33650] Another function of VGAM885 is therefore inhibition of LOC219920 (Accession XM\_167787). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC256239 (Accession XM\_170510) is another VGAM885 host target gene. LOC256239 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256239 BINDING SITE, designated SEQ ID:45344, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33651] Another function of VGAM885 is therefore inhibition of LOC256239 (Accession XM\_170510). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC256239. LOC91960 (Accession XM\_041872) is another VGAM885 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33614, to the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, also designated SEQ ID:3596.

[33652] Another function of VGAM885 is therefore inhibition of LOC91960 (Accession XM\_041872). Accordingly, utilities of VGAM885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 886 (VGAM886) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33653] VGAM886 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM886 was detected is described hereinabove with reference to Figs. 1–8.

[33654] VGAM886 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33655] VGAM886 gene encodes a VGAM886 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM886 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM886 precursor RNA is designated SEQ ID:872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:872 is located at position 68429 relative to the genome of Vaccinia Virus.

[33656] VGAM886 precursor RNA folds onto itself, forming VGAM886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33657] An enzyme complex designated DICER COMPLEX, `dices` the VGAM886 folded precursor RNA into VGAM886 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM886 RNA is designated SEQ ID:3597, and is provided hereinbelow with reference to the sequence listing part.

[33658] VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM886 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33659] VGAM886 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM886 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM886 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33660] The complementary binding of VGAM886 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM886 host target RNA into VGAM886 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33661] It is appreciated that VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM886 host target genes. The mRNA of each one of this plurality of VGAM886 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM886 RNA, herein designated VGAM RNA, and which when bound by VGAM886 RNA causes inhibition of translation of respective one or more VGAM886 host target proteins.

[33662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM886 gene, herein designated VGAM GENE, on one or more VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33663] It is yet further appreciated that a function of VGAM886 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM886 correlate with, and may be deduced from, the identity of the host target genes which VGAM886 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33664] Nucleotide sequences of the VGAM886 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM886 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM886 are further described hereinbelow with reference to Table 1.

[33665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM886 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM886 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33666] As mentioned hereinabove with reference to Fig. 1, a function of VGAM886 gene, herein designated VGAM is inhibition of expression of VGAM886 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM886 correlate with, and may be deduced from, the identity of the target genes which VGAM886 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33667] SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM\_000346) is a VGAM886 host target gene. SOX9 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:5899, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33668] A function of VGAM886 is therefore inhibition of SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM\_000346), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9. The function of SOX9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.KIAA0982 (Accession NM\_014023) is another VGAM886 host target gene. KIAA0982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0982, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:15247, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33669] Another function of VGAM886 is therefore inhibition of KIAA0982 (Accession NM\_014023). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982. KIAA1028 (Accession XM\_166324) is another VGAM886 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44155, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33670] Another function of VGAM886 is therefore inhibition of KIAA1028 (Accession XM\_166324). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1028. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889) is another VGAM886 host target gene. PC-QAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:18032, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33671] Another function of VGAM886 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531) is another VGAM886 host target gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:43523, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33672] Another function of VGAM886 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. RCD-8 (Accession NM\_014329) is another VGAM886 host target gene. RCD-8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCD-8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:15641, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33673] Another function of VGAM886 is therefore inhibition of RCD-8 (Accession NM\_014329). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RCD-8. SMOC2 (Accession XM\_051452) is another VGAM886 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35832, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33674] Another function of VGAM886 is therefore inhibition of SMOC2 (Accession XM\_051452). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. Synaptojanin 2 (SYNJ2, Accession XM\_029746) is another VGAM886 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:30942, to the nucleotide sequence of

VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33675] Another function of VGAM886 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM\_029746). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. Testis Specific, 14 (TSGA14, Accession NM\_018718) is another VGAM886 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSGA14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:20793, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33676] Another function of VGAM886 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM\_018718). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. LOC197201 (Accession XM\_113839) is another VGAM886 host target gene.

LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42465, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33677] Another function of VGAM886 is therefore inhibition of LOC197201 (Accession XM\_113839). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC219401 (Accession XM\_166706) is another VGAM886 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44587, to the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, also designated SEQ ID:3597.

[33678] Another function of VGAM886 is therefore inhibition of LOC219401 (Accession XM\_166706). Accordingly, utilities of VGAM886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 887 (VGAM887) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33679] VGAM887 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM887 was detected is described hereinabove with reference to Figs. 1–8.

[33680] VGAM887 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33681] VGAM887 gene encodes a VGAM887 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM887

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM887 precursor RNA is designated SEQ ID:873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:873 is located at position 67126 relative to the genome of Vaccinia Virus.

[33682] VGAM887 precursor RNA folds onto itself, forming VGAM887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33683] An enzyme complex designated DICER COMPLEX, `dices` the VGAM887 folded precursor RNA into VGAM887 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM887 RNA is designated SEQ ID:3598, and is provided hereinbelow with reference to the sequence listing part.

[33684] VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM887 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33685] VGAM887 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM887 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM887 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33686] The complementary binding of VGAM887 RNA, herein designated VGAM RNA, to host target binding sites on VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM887 host target RNA into VGAM887 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33687] It is appreciated that VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM887 host target genes. The mRNA of each one of this plurality of VGAM887 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM887 RNA, herein designated VGAM RNA, and which when bound by VGAM887 RNA causes inhibition of translation of respective one or more VGAM887 host target proteins.

[33688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM887 gene, herein designated VGAM GENE, on one or more VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33689] It is yet further appreciated that a function of VGAM887 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM887 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM887 correlate with, and may be deduced from, the identity of the host target genes which VGAM887 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33690] Nucleotide sequences of the VGAM887 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM887 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM887 are further described hereinbelow with reference to Table 1.

[33691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM887 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM887 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[33692] As mentioned hereinabove with reference to Fig. 1, a function of VGAM887 gene, herein designated VGAM is inhibition of expression of VGAM887 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM887 correlate with, and may be deduced from, the identity of the target genes which VGAM887 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33693] Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898) is a VGAM887 host target gene. M11S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by M11S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12516, to the nucleotide sequence of VGAM887 RNA, herein designated VGAM RNA, also designated SEQ ID:3598.

[33694] A function of VGAM887 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898), a gene which may play a

role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M11S1. The function of M11S1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Placenta-specific 1 (PLAC1, Accession NM\_021796) is another VGAM887 host target gene. PLAC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC1 BINDING SITE, designated SEQ ID:22352, to the nucleotide sequence of VGAM887 RNA, herein designated VGAM RNA, also designated SEQ ID:3598.

[33695] Another function of VGAM887 is therefore inhibition of Placenta-specific 1 (PLAC1, Accession NM\_021796). Accordingly, utilities of VGAM887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC1. Ubiquitin Protein Ligase E3A (human

papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838) is another VGAM887 host target gene. UBE3A BINDING SITE1 through UBE3A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE1 through UBE3A BINDING SITE3, designated SEQ ID:28360, SEQ ID:28364 and SEQ ID:6079 respectively, to the nucleotide sequence of VGAM887 RNA, herein designated VGAM RNA, also designated SEQ ID:3598.

[33696] Another function of VGAM887 is therefore inhibition of Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838). Accordingly, utilities of VGAM887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A. LOC91250 (Accession XM\_037135) is another VGAM887 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:32548, to the nucleotide sequence of VGAM887 RNA, herein designated VGAM RNA, also designated SEQ ID:3598.

[33697] Another function of VGAM887 is therefore inhibition of LOC91250 (Accession XM\_037135). Accordingly, utilities of VGAM887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 888 (VGAM888) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33698] VGAM888 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM888 was detected is described hereinabove with reference to Figs. 1–8.

[33699] VGAM888 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4.

VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33700] VGAM888 gene encodes a VGAM888 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM888 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM888 precursor RNA is designated SEQ ID:874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:874 is located at position 7588 relative to the genome of Human Herpesvirus 4.

[33701] VGAM888 precursor RNA folds onto itself, forming VGAM888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33702] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM888 folded precursor RNA into VGAM888 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM888 RNA is designated SEQ ID:3599, and is provided hereinbelow with reference to the sequence listing part.

[33703] VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM888 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33704] VGAM888 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM888 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM888 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33705] The complementary binding of VGAM888 RNA, herein designated VGAM RNA, to host target binding sites on VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM888 host target RNA into VGAM888 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33706] It is appreciated that VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM888 host target genes. The mRNA of each one of this plurality of VGAM888 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM888 RNA, herein designated VGAM RNA, and which when bound by VGAM888 RNA causes inhibition of translation of respective one or more VGAM888 host target proteins.

[33707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM888 gene, herein designated VGAM GENE, on one or more VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33708] It is yet further appreciated that a function of VGAM888 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM888 correlate with, and may be deduced from, the identity of the host target genes which VGAM888 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33709] Nucleotide sequences of the VGAM888 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM888 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM888 are further described hereinbelow with reference to Table 1.

- [33710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM888 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM888 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM888 gene, herein designated VGAM is inhibition of expression of VGAM888 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM888 correlate with, and may be deduced from, the identity of the target genes which VGAM888 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [33712] Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326) is a VGAM888 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TNFSF4 BINDING SITE, designated SEQ ID:9331, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33713] A function of VGAM888 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.FLJ20038 (Accession NM\_017634) is another VGAM888 host target gene. FLJ20038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20038 BINDING SITE, designated SEQ ID:19141, to the nucleotide sequence of VGAM888

RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33714] Another function of VGAM888 is therefore inhibition of FLJ20038 (Accession NM\_017634). Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20038. KIAA1805 (Accession XM\_086976) is another VGAM888 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:39000, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33715] Another function of VGAM888 is therefore inhibition of KIAA1805 (Accession XM\_086976). Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. MSTP032 (Accession NM\_025226) is another VGAM888 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24908, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33716] Another function of VGAM888 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. NCK Adaptor Protein 1 (NCK1, Accession NM\_006153) is another VGAM888 host target gene. NCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCK1 BINDING SITE, designated SEQ ID:12810, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33717] Another function of VGAM888 is therefore inhibition of NCK Adaptor Protein 1 (NCK1, Accession NM\_006153).

Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCK1. LOC120114 (Accession XM\_061871) is another VGAM888 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37214, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33718] Another function of VGAM888 is therefore inhibition of LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC146669 (Accession XM\_085534) is another VGAM888 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38223, to the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, also designated SEQ ID:3599.

[33719] Another function of VGAM888 is therefore inhibition of LOC146669 (Accession XM\_085534). Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146669. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 889 (VGAM889) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33720] VGAM889 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM889 was detected is described hereinabove with reference to Figs. 1–8.

[33721] VGAM889 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[33722] VGAM889 gene encodes a VGAM889 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM889 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM889 precursor RNA is designated SEQ ID:875, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:875 is located at position 9562 relative to the genome of Human Herpesvirus 4.

[33723] VGAM889 precursor RNA folds onto itself, forming VGAM889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33724] An enzyme complex designated DICER COMPLEX, `dices` the VGAM889 folded precursor RNA into VGAM889 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM889 RNA is designated SEQ ID:3600, and is provided hereinbelow with reference to the sequence listing part.

[33725] VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM889 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33726] VGAM889 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM889 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM889 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33727] The complementary binding of VGAM889 RNA, herein designated VGAM RNA, to host target binding sites on VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM889 host target RNA into VGAM889 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33728] It is appreciated that VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM889 host target genes. The mRNA of each one of this plurality of VGAM889 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM889 RNA, herein designated VGAM RNA, and which when bound by VGAM889 RNA causes inhibition of translation of respective one or more VGAM889 host target proteins.

[33729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM889 gene, herein designated VGAM GENE, on one or more VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33730] It is yet further appreciated that a function of VGAM889 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM889 correlate with, and may be deduced from, the identity of the host target genes which VGAM889 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33731] Nucleotide sequences of the VGAM889 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM889 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM889 are further described hereinbelow with reference to Table 1.

[33732] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM889 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM889 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33733] As mentioned hereinabove with reference to Fig. 1, a function of VGAM889 gene, herein designated VGAM is inhibition of expression of VGAM889 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM889 correlate with, and may be deduced from, the identity of the target genes which VGAM889 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33734] Microfibrillar-associated Protein 4 (MFAP4, Accession XM\_045044) is a VGAM889 host target gene. MFAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFAP4 BINDING SITE, designated SEQ ID:34328, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33735] A function of VGAM889 is therefore inhibition of Microfibrillar-associated Protein 4 (MFAP4, Accession XM\_045044). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFAP4. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662) is another VGAM889 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19197, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33736] Another function of VGAM889 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of

TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM\_014145) is another VGAM889 host target gene. C20orf30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf30 BINDING SITE, designated SEQ ID:15431, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33737] Another function of VGAM889 is therefore inhibition of Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM\_014145). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf30. DKFZP434P211 (Accession NM\_014549) is another VGAM889 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434P211, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15866, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33738] Another function of VGAM889 is therefore inhibition of DKFZP434P211 (Accession NM\_014549). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM889 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28531, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33739] Another function of VGAM889 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A

(GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. IMP-2 (Accession NM\_006548) is another VGAM889 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:13303, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33740] Another function of VGAM889 is therefore inhibition of IMP-2 (Accession NM\_006548). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KIAA0164 (Accession NM\_014739) is another VGAM889 host target gene. KIAA0164 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0164 BINDING SITE, designated SEQ ID:16405, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33741] Another function of VGAM889 is therefore inhibition of KIAA0164 (Accession NM\_014739). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0164. KIAA1389 (Accession XM\_045839) is another VGAM889 host target gene. KIAA1389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1389 BINDING SITE, designated SEQ ID:34569, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33742] Another function of VGAM889 is therefore inhibition of KIAA1389 (Accession XM\_045839). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1389. KIAA1416 (Accession XM\_098762) is another

VGAM889 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41801, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33743] Another function of VGAM889 is therefore inhibition of KIAA1416 (Accession XM\_098762). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552) is another VGAM889 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:21769 and SEQ ID:21775 respectively, to the nucleotide sequence of

VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33744] Another function of VGAM889 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC199858 (Accession XM\_114040) is another VGAM889 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42633, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33745] Another function of VGAM889 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC256176 (Accession XM\_172889) is another VGAM889 host target gene. LOC256176 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256176 BINDING SITE, designated SEQ ID:46170, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33746] Another function of VGAM889 is therefore inhibition of LOC256176 (Accession XM\_172889). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256176. LOC57105 (Accession NM\_020377) is another VGAM889 host target gene. LOC57105 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57105 BINDING SITE, designated SEQ ID:21637, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33747] Another function of VGAM889 is therefore inhibition of

LOC57105 (Accession NM\_020377). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57105. LOC81558 (Accession NM\_030802) is another VGAM889 host target gene. LOC81558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC81558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81558 BINDING SITE, designated SEQ ID:25109, to the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, also designated SEQ ID:3600.

[33748] Another function of VGAM889 is therefore inhibition of LOC81558 (Accession NM\_030802). Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81558. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 890 (VGAM890) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[33749] VGAM890 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM890 was detected is described hereinabove with reference to Figs. 1–8.

[33750] VGAM890 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33751] VGAM890 gene encodes a VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM890 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM890 precursor RNA is designated SEQ ID:876, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:876 is located at position 8059 relative to the genome of Human Herpesvirus 4.

[33752] VGAM890 precursor RNA folds onto itself, forming VGAM890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[33753] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM890 folded precursor RNA into VGAM890 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM890 RNA is designated SEQ ID:3601, and  
is provided hereinbelow with reference to the sequence  
listing part.

[33754] VGAM890 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM890 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM890 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[33755] VGAM890 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM890 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM890 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[33756] The complementary binding of VGAM890 RNA, herein designated VGAM RNA, to host target binding sites on VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM890 host target RNA into VGAM890 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33757] It is appreciated that VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM890 host target genes. The mRNA of each one of this plurality of VGAM890 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM890 RNA, herein designated VGAM RNA, and which when bound by VGAM890 RNA causes inhibition of translation of respective one or more VGAM890 host target proteins.

[33758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM890 gene, herein designated VGAM GENE, on one or

more VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33759] It is yet further appreciated that a function of VGAM890 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM890 correlate with, and may be deduced from, the identity of the host target genes which VGAM890 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [33760] Nucleotide sequences of the VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM890 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM890 are further described hereinbelow with reference to Table 1.
- [33761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM890 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM890 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [33762] As mentioned hereinabove with reference to Fig. 1, a function of VGAM890 gene, herein designated VGAM is inhibition of expression of VGAM890 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM890 correlate with, and may be deduced from, the identity of the target genes which VGAM890 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [33763] GAC1 (Accession NM\_006338) is a VGAM890 host target

gene. GAC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAC1 BINDING SITE, designated SEQ ID:13036, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33764] A function of VGAM890 is therefore inhibition of GAC1 (Accession NM\_006338). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAC1. Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020) is another VGAM890 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22004, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33765] Another function of VGAM890 is therefore inhibition of Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to *C. elegans* UNC-76. Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 has been established by previous studies. Ishii et al. (1999) positionally cloned and characterized the FEZ1/LZTS1 (leucine zipper, putative tumor suppressor-1) gene at 8p22, a region that is lost in many tumors, including prostate, breast, head and neck, esophageal, and urinary bladder carcinomas. The predicted FEZ1 protein contained a leucine-zipper region with similarity to the DNA-binding domain of the cAMP-responsive activating transcription factor-5 (OMIM Ref. No. 606398). Northern blot analysis revealed that FEZ2 is expressed almost ubiquitously in normal tissues, although expression is most abundant in testes. FEZ1 expression was undetectable in more than 60% of epithelial tumors, but FEZ1 mutations were found in primary esophageal cancers and in a prostate cancer cell line. Transcript analysis from several FEZ1-expressing tumors revealed truncated mRNAs, in-

cluding a frameshift. Alteration and inactivation of the FEZ1 gene may play a role in various human tumors. Ishii et al. (2001) showed that introduction of FEZ1/LZTS1 into FEZ1/LZTS1-negative cancer cells resulted in suppression of tumorigenicity and reduced cell growth with accumulation of cells at late S-G2/M stage of the cell cycle. Their data showed that FEZ1/LZTS1 inhibits cancer cell growth through regulation of mitosis, and that its alterations result in abnormal cell growth. Ishii et al. (1999) analyzed the nucleotide sequence of the FEZ1 gene open reading frame in 194 cancers, including 72 primary esophageal cancers. They found a point mutation in 2 primary esophageal cancers and in a prostate cancer cell line.

[33766] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33767] Ishii, H.; Baffa, R.; Numata, S.-I.; Murakumo, Y.; Rattan, S.; Inoue, H.; Mori, M.; Fidanza, V.; Alder, H.; Croce, C. M. : The FEZ1 gene at chromosome 8p22 encodes a leucine-zipper protein, and its expression is altered in multiple human tumors. Proc. Nat. Acad. Sci. 96: 3928-3933, 1999. ; and

[33768] Ishii, H.; Vecchione, A.; Murakumo, Y.; Baldassarre, G.;

Numata, S.; Trapasso, F.; Alder, H.; Baffa, R.; Croce, C. M. :  
FEZ1/LZTS1 gene at 8p22 suppresses cancer cell growth  
and regula.

[33769] Further studies establishing the function and utilities of  
LZTS1 are found in John Hopkins OMIM database record ID  
606551, and in cited publications numbered 4650 listed  
in the bibliography section hereinbelow, which are also  
hereby incorporated by reference. Sulfite Oxidase (SUOX,  
Accession NM\_000456) is another VGAM890 host target  
gene. SUOX BINDING SITE is HOST TARGET binding site  
found in the 5' untranslated region of mRNA encoded by  
SUOX, corresponding to a HOST TARGET binding site such  
as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-  
ble 2 illustrates the complementarity of the nucleotide se-  
quences of SUOX BINDING SITE, designated SEQ ID:6071,  
to the nucleotide sequence of VGAM890 RNA, herein des-  
ignated VGAM RNA, also designated SEQ ID:3601.

[33770] Another function of VGAM890 is therefore inhibition of  
Sulfite Oxidase (SUOX, Accession NM\_000456), a gene  
which sulfite oxidase deficiency. Accordingly, utilities of  
VGAM890 include diagnosis, prevention and treatment of  
diseases and clinical conditions associated with SUOX. The  
function of SUOX has been established by previous stud-

ies. Garrett et al. (1995) isolated a 2.4-kb cDNA clone of human sulfite oxidase from a human liver cDNA library. The deduced 488-amino acid protein has a molecular mass of approximately 52 kD and shows 88% homology to the rat protein and 67% homology to the chicken protein. Comparison of 3 sulfite oxidase sequences to several plant and fungal nitrate reductase sequences revealed a single conserved cysteine with highly conserved flanking sequences. Garrett et al. (1995) postulated that the conserved cysteine is a ligand of molybdenum in sulfite oxidase and nitrate reductase. Kisker et al. (1997) determined the crystal structure of chicken liver sulfite oxidase, which is homologous to the human protein, at 1.9-angstrom resolution. They found that each monomer of the dimeric enzyme consists of 3 domains. At the active site, the Mo is penta-coordinated by 3 sulfur ligands, 1 oxo group, and 1 water/hydroxo. A sulfate molecule adjacent to the Mo identifies the substrate binding pocket.

[33771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33772] Garrett, R. M.; Bellissimo, D. B.; Rajagopalan, K. V. : Molecular cloning of human liver sulfite oxidase. *Biochim.*

Biophys. Acta 1262: 147–149, 1995. ; and

[33773] Kisker, C.; Schindelin, H.; Pacheco, A.; Wehbi, W. A.; Garrett, R. M.; Rajagopalan, K. V.; Enemark, J. H.; Rees, D. C. : Molecular basis of sulfite oxidase deficiency from the structur.

[33774] Further studies establishing the function and utilities of SUOX are found in John Hopkins OMIM database record ID 606887, and in cited publications numbered 5393, 870 and 8706 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ20297 (Accession NM\_017751) is another VGAM890 host target gene. FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2, designated SEQ ID:19357 and SEQ ID:19646 respectively, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33775] Another function of VGAM890 is therefore inhibition of FLJ20297 (Accession NM\_017751). Accordingly, utilities of

VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. KIAA1867 (Accession XM\_170675) is another VGAM890 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45453, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33776] Another function of VGAM890 is therefore inhibition of KIAA1867 (Accession XM\_170675). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1867. KIAA1940 (Accession XM\_086981) is another VGAM890 host target gene. KIAA1940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1940 BINDING SITE, designated SEQ ID:39009, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33777] Another function of VGAM890 is therefore inhibition of KIAA1940 (Accession XM\_086981). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1940. Peptidylprolyl Isomerase (cyclophilin)-like 2 (PPIL2, Accession NM\_014337) is another VGAM890 host target gene. PPIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL2 BINDING SITE, designated SEQ ID:15649, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33778] Another function of VGAM890 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 2 (PPIL2, Accession NM\_014337). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL2. PR Domain Con-

taining 10 (PRDM10, Accession NM\_020228) is another VGAM890 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21496, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33779] Another function of VGAM890 is therefore inhibition of PR Domain Containing 10 (PRDM10, Accession NM\_020228). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. TOPBP1 (Accession NM\_007027) is another VGAM890 host target gene. TOPBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOPBP1 BINDING SITE, designated SEQ ID:13886, to the nucleotide sequence of VGAM890 RNA, herein designated

VGAM RNA, also designated SEQ ID:3601.

[33780] Another function of VGAM890 is therefore inhibition of TOPBP1 (Accession NM\_007027). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPBP1. LOC150776 (Accession XM\_032542) is another VGAM890 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31673, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33781] Another function of VGAM890 is therefore inhibition of LOC150776 (Accession XM\_032542). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC152274 (Accession XM\_087418) is another VGAM890 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152274, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39230, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33782] Another function of VGAM890 is therefore inhibition of LOC152274 (Accession XM\_087418). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC199837 (Accession XM\_114034) is another VGAM890 host target gene. LOC199837 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199837 BINDING SITE, designated SEQ ID:42626, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33783] Another function of VGAM890 is therefore inhibition of LOC199837 (Accession XM\_114034). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC199837. LOC255104 (Accession XM\_170911) is another VGAM890 host target gene. LOC255104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255104 BINDING SITE, designated SEQ ID:45682, to the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, also designated SEQ ID:3601.

[33784] Another function of VGAM890 is therefore inhibition of LOC255104 (Accession XM\_170911). Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 891 (VGAM891) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33785] VGAM891 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM891 was detected is described hereinabove with reference to Figs. 1–8.

[33786] VGAM891 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33787] VGAM891 gene encodes a VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM891 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM891 precursor RNA is designated SEQ ID:877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:877 is located at position 7900 relative to the genome of Human Herpesvirus 4.

[33788] VGAM891 precursor RNA folds onto itself, forming VGAM891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33789] An enzyme complex designated DICER COMPLEX, `dices` the VGAM891 folded precursor RNA into VGAM891 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM891 RNA is designated SEQ ID:3602, and is provided hereinbelow with reference to the sequence listing part.

[33790] VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM891 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33791] VGAM891 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM891 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM891 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33792] The complementary binding of VGAM891 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM891 host target RNA into VGAM891 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33793] It is appreciated that VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM891 host target genes. The mRNA of each one of this plurality of VGAM891 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM891 RNA, herein designated VGAM RNA, and which when bound by VGAM891 RNA causes inhibition of translation of respective one or more VGAM891 host target proteins.

[33794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM891 gene, herein designated VGAM GENE, on one or more VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33795] It is yet further appreciated that a function of VGAM891 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM891 correlate with, and may be deduced from, the identity of the host target genes which VGAM891 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33796] Nucleotide sequences of the VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM891 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM891 are further described hereinbelow with reference to Table 1.

[33797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM891 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM891 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33798] As mentioned hereinabove with reference to Fig. 1, a function of VGAM891 gene, herein designated VGAM is inhibition of expression of VGAM891 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM891 correlate with, and may be deduced from, the identity of the target genes which VGAM891 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33799] Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326) is a VGAM891 host tar-

get gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9331, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33800] A function of VGAM891 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.FLJ20038 (Accession NM\_017634) is another VGAM891 host target gene. FLJ20038 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by FLJ20038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20038 BINDING SITE, designated SEQ ID:19141, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33801] Another function of VGAM891 is therefore inhibition of FLJ20038 (Accession NM\_017634). Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20038. KIAA1805 (Accession XM\_086976) is another VGAM891 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:39000, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33802] Another function of VGAM891 is therefore inhibition of KIAA1805 (Accession XM\_086976). Accordingly, utilities

of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. MSTP032 (Accession NM\_025226) is another VGAM891 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24908, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33803] Another function of VGAM891 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. NCK Adaptor Protein 1 (NCK1, Accession NM\_006153) is another VGAM891 host target gene. NCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCK1 BIND-

ING SITE, designated SEQ ID:12810, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33804] Another function of VGAM891 is therefore inhibition of NCK Adaptor Protein 1 (NCK1, Accession NM\_006153). Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCK1. LOC120114 (Accession XM\_061871) is another VGAM891 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37214, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33805] Another function of VGAM891 is therefore inhibition of LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC146669 (Accession XM\_085534) is an-

other VGAM891 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38223, to the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, also designated SEQ ID:3602.

[33806] Another function of VGAM891 is therefore inhibition of LOC146669 (Accession XM\_085534). Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146669. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 892 (VGAM892) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33807] VGAM892 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM892 was detected is described

hereinabove with reference to Figs. 1–8.

[33808] VGAM892 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Periplaneta Fuliginosa Densovirus. VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33809] VGAM892 gene encodes a VGAM892 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM892 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM892 precursor RNA is designated SEQ ID:878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:878 is located at position 4066 relative to the genome of Periplaneta Fuliginosa Densovirus.

[33810] VGAM892 precursor RNA folds onto itself, forming VGAM892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33811] An enzyme complex designated DICER COMPLEX, `dices` the VGAM892 folded precursor RNA into VGAM892 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM892 RNA is designated SEQ ID:3603, and is provided hereinbelow with reference to the sequence listing part.

[33812] VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM892 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33813] VGAM892 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM892 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM892 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33814] The complementary binding of VGAM892 RNA, herein designated VGAM RNA, to host target binding sites on VGAM892 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM892 host target RNA into VGAM892 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33815] It is appreciated that VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM892 host target genes. The mRNA of each one of this plurality of VGAM892 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM892 RNA, herein designated VGAM RNA, and which when bound by VGAM892 RNA causes inhibition of translation of respective one or more VGAM892 host target proteins.

[33816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM892 gene, herein designated VGAM GENE, on one or more VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33817] It is yet further appreciated that a function of VGAM892 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM892 include diagnosis, prevention and treatment of viral infection by Periplaneta Fuliginosa Densovirus. Specific functions, and accordingly utilities, of VGAM892 correlate with, and may be deduced from, the identity of the host target genes which VGAM892 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33818] Nucleotide sequences of the VGAM892 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM892 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM892 are further described hereinbelow with reference to Table 1.

[33819] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM892 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM892 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33820] As mentioned hereinabove with reference to Fig. 1, a function of VGAM892 gene, herein designated VGAM is inhibition of expression of VGAM892 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM892 correlate with, and may be deduced from, the identity of the target genes which VGAM892 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33821] Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842) is a VGAM892 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9939, to the nucleotide sequence of VGAM892 RNA, herein designated VGAM RNA, also designated SEQ ID:3603.

[33822] A function of VGAM892 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. LOC146880 (Accession XM\_085627) is another VGAM892 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, desig-

nated SEQ ID:38258, to the nucleotide sequence of VGAM892 RNA, herein designated VGAM RNA, also designated SEQ ID:3603.

[33823] Another function of VGAM892 is therefore inhibition of LOC146880 (Accession XM\_085627). Accordingly, utilities of VGAM892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146880. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 893 (VGAM893) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33824] VGAM893 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM893 was detected is described hereinabove with reference to Figs. 1–8.

[33825] VGAM893 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Periplaneta Fuliginosa Densovirus. VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33826] VGAM893 gene encodes a VGAM893 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM893 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM893 precursor RNA is designated SEQ ID:879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:879 is located at position 2 relative to the genome of *Periplaneta Fuliginosa* Densovirus.

[33827] VGAM893 precursor RNA folds onto itself, forming VGAM893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33828] An enzyme complex designated DICER COMPLEX, `dices` the VGAM893 folded precursor RNA into VGAM893 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM893 RNA is designated SEQ ID:3604, and is provided hereinbelow with reference to the sequence listing part.

[33829] VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM893 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33830] VGAM893 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM893 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM893 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33831] The complementary binding of VGAM893 RNA, herein designated VGAM RNA, to host target binding sites on VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM893 host target RNA into VGAM893 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33832] It is appreciated that VGAM893 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM893 host target genes. The mRNA of each one of this plurality of VGAM893 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM893 RNA, herein designated VGAM RNA, and which when bound by VGAM893 RNA causes inhibition of translation of respective one or more VGAM893 host target proteins.

[33833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM893 gene, herein designated VGAM GENE, on one or more VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[33834] It is yet further appreciated that a function of VGAM893 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of viral infection by Periplaneta Fuliginosa Densovirus. Specific functions, and accordingly utilities, of VGAM893 correlate with, and may be deduced from, the identity of the host target genes which VGAM893 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33835] Nucleotide sequences of the VGAM893 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM893 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM893 are further described hereinbelow with reference to Table 1.

[33836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM893 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM893 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33837] As mentioned hereinabove with reference to Fig. 1, a function of VGAM893 gene, herein designated VGAM is inhibition of expression of VGAM893 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM893 correlate with, and may be deduced from, the identity of the target genes which VGAM893 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33838] Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM\_001407) is a VGAM893 host target gene. CELSR3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CELSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR3 BINDING SITE, designated SEQ ID:7104, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33839] A function of VGAM893 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, *Drosophila*) (CELSR3, Accession NM\_001407), a gene which interacts in a homophilic manner in connecting cells. Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR3. The function of CELSR3 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins with EGF-like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in specific protein-protein interactions. To identify proteins containing EGF-like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF-like motif. They identified several partial cDNAs encoding novel proteins with EGF-like domains, such as EGFL1, which they named MEGF2. Nakayama et al.

(1998) isolated a rat cDNA containing the complete Megf2 coding sequence. The predicted Megf2 protein has a signal sequence, 8 cadherin motifs (see OMIM Ref. No. 603006), 6 EGF-like domains, 2 laminin G domains (see OMIM Ref. No. 601033), 7 transmembrane domains, and a cytoplasmic proline-rich sequence. Megf2 appears to have a domain structure identical to that of human MEGF3 (OMIM Ref. No. 604265), whose partial cDNA was also isolated by the authors. Northern blot analysis detected Megf2 expression in several regions of rat brain.

[33840] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33841] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high-molecular-weight proteins with multiple EGF-like motifs by motif-trap screening. Genomics 51: 27-34, 1998. ; and

[33842] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. Proc. Nat. Acad. Sci. 97: 3124-3129, 2000.

[33843] Further studies establishing the function and utilities of CELSR3 are found in John Hopkins OMIM database record ID 604264, and in cited publications numbered

7437–7438 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DXS1283E (Accession XM\_047871) is another VGAM893 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35069, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33844] Another function of VGAM893 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235) is another VGAM893 host target gene. KCNA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:8018, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33845] Another function of VGAM893 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6. The function of KCNA6 has been established by previous studies. By screening a human fetal cDNA library with a rat RCK3 potassium channel cDNA, Grupe et al. (1990) isolated cDNAs encoding a protein that they designated HBK2 (human brain potassium channel-2). The authors also cloned cDNAs corresponding to the rat homolog, RCK2. The predicted 529-amino acid HBK2 protein shares 94% identity with RCK2. HBK2 and RCK2 have the characteristic structure of voltage-gated ionic channels, with 6 potential membrane-spanning segments. When expressed in *Xenopus* oocytes, the HBK2/RCK2 channels ex-

hibited the functional characteristics of a delayed-rectifier channel that acts especially in the more positive membrane voltage range. The functional and pharmacologic properties of HBK2/RCK2 potassium channels were distinct from those of previously characterized channels.

Grupe et al. (1990) determined that the HBK2 gene did not contain introns. Using interspecific backcrosses between *Mus musculus* and *Mus spretus*, Klocke et al. (1993) mapped the mouse gene encoding the Kv1.6 potassium voltage-gated channel, *Kcna6*, to chromosome 6 in a cluster with *Kcna1*, *Kcna5* (OMIM Ref. No. 176267), and the homolog of human TPI1 (OMIM Ref. No. 190450).

Since human TPI1 is located on band 12p13, Klocke et al. (1993) predicted that the human KCNA6 gene is located on 12p near other genes of the Shaker-related subfamily, KCNA1 and KCNA5. Albrecht et al. (1995) determined that a 300-kb cluster on chromosome 12p13 contains the human KCNA6, KCNA1, and KCNA5 genes arranged in tandem

[33846] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33847] Albrecht, B.; Weber, K.; Pongs, O. : Characterization of a

voltage-activated K-channel gene cluster on human chromosome 12p13. Receptors Channels 3: 213-220, 1995. ; and

[33848] Grupe, A.; Schroter, K. H.; Ruppertsberg, J. P.; Stocker, M.; Drewes, T.; Beckh, S.; Pongs, O. : Cloning and expression of a human voltage-gated potassium channel: a novel member of the R.

[33849] Further studies establishing the function and utilities of KCNA6 are found in John Hopkins OMIM database record ID 176257, and in cited publications numbered 10288-10290 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Spinocerebellar Ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NM\_000332) is another VGAM893 host target gene. SCA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCA1 BINDING SITE, designated SEQ ID:5881, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33850] Another function of VGAM893 is therefore inhibition of Spinocerebellar Ataxia 1 (olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) (SCA1, Accession NM\_000332). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCA1. Ganglioside Induced Differentiation Associated Protein 2 (GDAP2, Accession NM\_017686) is another VGAM893 host target gene. GDAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDAP2 BINDING SITE, designated SEQ ID:19240, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33851] Another function of VGAM893 is therefore inhibition of Ganglioside Induced Differentiation Associated Protein 2 (GDAP2, Accession NM\_017686). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDAP2. KIAA1708 (Accession XM\_040211) is another VGAM893

host target gene. KIAA1708 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1708, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1708 BINDING SITE, designated SEQ ID:33273, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33852] Another function of VGAM893 is therefore inhibition of KIAA1708 (Accession XM\_040211). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1708. MRF2 (Accession XM\_084482) is another VGAM893 host target gene. MRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRF2 BINDING SITE, designated SEQ ID:37602, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33853] Another function of VGAM893 is therefore inhibition of MRF2 (Accession XM\_084482). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRF2. PHD Finger Protein 5A (PHF5A, Accession NM\_032758) is another VGAM893 host target gene. PHF5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHF5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHF5A BINDING SITE, designated SEQ ID:26502, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33854] Another function of VGAM893 is therefore inhibition of PHD Finger Protein 5A (PHF5A, Accession NM\_032758). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF5A. SERP1 (Accession NM\_014445) is another VGAM893 host target gene. SERP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERP1 BINDING SITE, designated SEQ ID:15796, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33855] Another function of VGAM893 is therefore inhibition of SERP1 (Accession NM\_014445). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERP1. LOC153196 (Accession XM\_098323) is another VGAM893 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41595, to the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, also designated SEQ ID:3604.

[33856] Another function of VGAM893 is therefore inhibition of LOC153196 (Accession XM\_098323). Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 894 (VGAM894) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33857] VGAM894 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM894 was detected is described hereinabove with reference to Figs. 1–8.

[33858] VGAM894 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Periplaneta Fuliginosa Densovirus. VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33859] VGAM894 gene encodes a VGAM894 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM894 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM894 precursor RNA is designated SEQ ID:880, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:880 is located at position 2107 relative to the genome of Periplaneta Fuliginosa Densovirus.

[33860] VGAM894 precursor RNA folds onto itself, forming VGAM894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33861] An enzyme complex designated DICER COMPLEX, `dices` the VGAM894 folded precursor RNA into VGAM894 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM894 RNA is designated SEQ ID:3605, and is provided hereinbelow with reference to the sequence listing part.

[33862] VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM894 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33863] VGAM894 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM894 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM894 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[33864] The complementary binding of VGAM894 RNA, herein designated VGAM RNA, to host target binding sites on VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM894 host target RNA into VGAM894 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33865] It is appreciated that VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM894 host target genes. The mRNA of each one of this plurality of VGAM894 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM894 RNA, herein designated VGAM RNA, and which when bound by VGAM894 RNA causes in-

hibition of translation of respective one or more VGAM894 host target proteins.

[33866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM894 gene, herein designated VGAM GENE, on one or more VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33867] It is yet further appreciated that a function of VGAM894 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM894 include diagnosis, prevention and

treatment of viral infection by *Periplaneta Fuliginosa* Densovirus. Specific functions, and accordingly utilities, of VGAM894 correlate with, and may be deduced from, the identity of the host target genes which VGAM894 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33868] Nucleotide sequences of the VGAM894 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM894 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM894 are further described hereinbelow with reference to Table 1.

[33869] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM894 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM894 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33870] As mentioned hereinabove with reference to Fig. 1, a function of VGAM894 gene, herein designated VGAM is inhibition of expression of VGAM894 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM894 correlate with, and may be deduced from, the identity of the target genes which VGAM894 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33871] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM\_014243) is a VGAM894 host target gene. ADAMTS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS3 BINDING SITE, designated SEQ ID:15510, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33872] A function of VGAM894 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM\_014243), a gene which cleaves the propeptides of type ii collagen prior to fibril assembly. Accordingly, utilities of VGAM894 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ADAMTS3. The function of ADAMTS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM211. Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM\_004337) is another VGAM894 host target gene. C8orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf1 BINDING SITE, designated SEQ ID:10533, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33873] Another function of VGAM894 is therefore inhibition of Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM\_004337). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf1. Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058197) is another VGAM894 host target gene. CDKN2A BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by CDKN2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2A BINDING SITE, designated SEQ ID:27760, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33874] Another function of VGAM894 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058197). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2A. Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM\_001889) is another VGAM894 host target gene. CRYZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRYZ BINDING SITE, designated SEQ ID:7617, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ

ID:3605.

[33875] Another function of VGAM894 is therefore inhibition of Crystallin, Zeta (quinone reductase) (CRYZ, Accession NM\_001889), a gene which may act in the detoxification of xenobiotics. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYZ. The function of CRYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104) is another VGAM894 host target gene. CYP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1B1 BINDING SITE, designated SEQ ID:5568, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33876] Another function of VGAM894 is therefore inhibition of

Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104), a gene which participates in the metabolism of a molecule that is a participant in eye development. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1B1. The function of CYP1B1 has been established by previous studies. In the study of candidate genes identified in the critical region of 2p21 where a major gene for primary congenital glaucoma, GLC3A (OMIM Ref. No. 231300), had been mapped by linkage studies, Stoilov et al. (1997) found the CYP1B1 gene, which had previously been identified by Sutter et al. (1994). From a determination of the intron/exon junctions of this gene, Stoilov et al. (1997) concluded that the gene contains 3 exons and 2 introns. The entire coding sequence of the genes is contained in exons 2 and 3. This genomic structure agreed with that reported by Tang et al. (1996). Screening for the presence of coding sequence changes in the CYP1B1 gene, Stoilov et al. (1997) identified 3 different truncating mutations: a 13-bp deletion found in 1 consanguineous and 1 nonconsanguineous family (601771.0001); a single cytosine insertion ob-

served in another 2 consanguineous families (601771.0002); and a large deletion found in an additional consanguineous family. In addition, a G-to-C transversion at nucleotide 1640 of the CYP1B1 coding sequence was found that caused a val432-to-leu amino acid substitution. This change created an EcoR57 restriction site, thus providing a rapid screening method. Heterozygosity for the val432-to-leu change was found in 51.4% of 70 normal individuals. This amino acid change was not in that part of CYP1B1 that represented conserved sequences, and both valine and leucine are neutral and hydrophobic. Their very similar aliphatic side groups differ by a single -CH<sub>2</sub> group. Therefore, this change appeared to represent a common amino acid polymorphism that is not related to the primary congenital glaucoma phenotype. Identification of CYP1B1 as the gene affected in primary congenital glaucoma was said by Stoilov et al. (1997) to be the first example in which mutations in a member of the cytochrome P450 superfamily results in a primary developmental defect. The finding was not unexpected, however, as a link between members of this superfamily and the processes of growth and differentiation had been postulated previously. They speculated that CYP1B1 par-

ticipates in the metabolism of an as-yet-unknown biologically active molecule that is a participant in eye development. Stoilov et al. (1997) demonstrated that a stable protein product is produced in the affected subjects of these families, and that the 3 mutations they described would be expected to result in a product lacking between 189 and 254 amino acids from the C terminus. This segment harbors the invariant cysteine of all known cytochrome P450 amino sequences; in CYP1B1 it is cys470. Schwartzman et al. (1987) implicated a cytochrome-P450-dependent arachidonate metabolite that inhibits Na<sup>+</sup>,K<sup>+</sup>-ATPase in the cornea in regulating corneal transparency and aqueous humor secretion. This finding is consistent with the clouding of the cornea and increased intraocular pressure, the 2 major diagnostic criteria for primary congenital glaucoma.

[33877] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33878] Bejjani, B. A.; Lewis, R. A.; Tomey, K. F.; Anderson, K. L.; Dueker, D. K.; Jabak, M.; Astle, W. F.; Otterud, B.; Leppert, M.; Lupski, J. R. : Mutations in CYP1B1, the gene for cytochrome P4501B1, are the predominant cause of primary

congenital glaucoma in Saudi Arabia. Am. J. Hum. Genet. 62: 325–333, 1998. ; and

[33879] Stoilov, I.; Akarsu, A. N.; Alozie, I.; Child, A.; Barsoum–Homsy, M.; Turacli, M. E.; Or, M.; Lewis, R. A.; Ozdemir, N.; Brice, G.; Aktan, S. G.; Chevrette, L.; Coca–Prados, M.; Sarfara.

[33880] Further studies establishing the function and utilities of CYP1B1 are found in John Hopkins OMIM database record ID 601771, and in cited publications numbered 8866–8867, 911 and 9123–9129 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box P2 (FOXP2, Accession NM\_014491) is another VGAM894 host target gene. FOXP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXP2 BINDING SITE, designated SEQ ID:15835, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33881] Another function of VGAM894 is therefore inhibition of

Forkhead Box P2 (FOXP2, Accession NM\_014491), a gene which may have a role in regulating neurodevelopment or neuroplasticity. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXP2. The function of FOXP2 has been established by previous studies. In a search for the gene responsible for the severe speech and language disorder (OMIM Ref. No. 602081) in the KE pedigree, Lai et al. (2001) isolated the FOXP2 gene. FOXP2 has an open reading frame (ORF) of 2.1 kb. The carboxy-terminal portion of the predicted protein sequence encoded by the FOXP2 gene contains a segment of 84 amino acids (encoded by exons 12–14) that shows high similarity to the characteristic DNA-binding domains of the forkhead-winged helix (FOX) family of transcription factors. By Northern blot analysis of several human adult tissues, Lai et al. (2001) demonstrated broad expression of a roughly 6.5-kb FOXP2 transcript. This transcript was also observed in fetal tissues, with strong expression in brain. A murine homolog of FOXP2 is expressed in adult and fetal mouse brain. The FOXP2 gene is mutated in a severe monogenic form of speech and language impairment, segregating within a single large pedigree, and is also

disrupted by a translocation in an isolated case. Several studies of autistic disorder have demonstrated linkage to a similar region of 7q (AUTS1; 209850), leading to the proposal that a single genetic factor on 7q31 contributes to both autism and language disorders. Newbury et al. (2002) used association and mutation screening analyses to evaluate directly the impact of the FOXP2 gene with regard to both complex language impairments and autism. They concluded that the coding region variants in FOXP2 do not underlie the AUTS1 linkage and that the gene is unlikely to play a role in autism or more common forms of language impairment.

[33882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33883] Lai, C. S. L.; Fisher, S. E.; Hurst, J. A.; Levy, E. R.; Hodgson, S.; Fox, M.; Jeremiah, S.; Povey, S.; Jamison, D. C.; Green, E. D.; Vargha-Khadem, F.; Monaco, A. P. : The SPCH1 region on human 7q31: genomic characterization of the critical interval and localization of translocations associated with speech and language disorder. *Am. J. Hum. Genet.* 67: 357–368, 2000. ; and

[33884] Newbury, D. F.; Bonora, E.; Lamb, J. A.; Fisher, S. E.; Lai, C.

S. L.; Baird, G.; Jannoun, L.; Slonims, V.; Stott, C. M.; Mericks, M. J.; Bolton, P. F.; Bailey, A. J.; Monaco, A. P.;

[33885] Further studies establishing the function and utilities of FOXP2 are found in John Hopkins OMIM database record ID 605317, and in cited publications numbered 4483–4484, 5967–596 and 8561 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 18 Receptor 1 (IL18R1, Accession NM\_003855) is another VGAM894 host target gene. IL18R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL18R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18R1 BINDING SITE, designated SEQ ID:9952, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33886] Another function of VGAM894 is therefore inhibition of Interleukin 18 Receptor 1 (IL18R1, Accession NM\_003855), a gene which is required for dorsal–ventral embryonic polarity and promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM894 include diagno–

sis, prevention and treatment of diseases and clinical conditions associated with IL18R1. The function of IL18R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM\_002398) is another VGAM894 host target gene. MEIS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:8219, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33887] Another function of VGAM894 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM\_002398), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1. The function of MEIS1 has

been established by previous studies. Homeo box genes, of which the most well-characterized category is represented by the HOX genes, play a crucial role in normal development. In addition, several homeoproteins are involved in neoplasia: PPX1 (OMIM Ref. No. 176310), HOXA10 (OMIM Ref. No. 142957), and HOXB8 (OMIM Ref. No. 142963) play important roles in leukemia. The Meis1 locus was isolated by Moskow et al. (1995) as a common site of viral integration involved in myeloid leukemia in BXH-2 mice. MEIS1 encodes a novel homeo box protein belonging to the TALE (three amino acid loop extension) family of homeodomain-containing proteins. The homeodomain of MEIS1 is the only conserved motif within the entire 390-amino acid protein. Steelman et al. (1997) described additional members of a related gene family, which they called Meis1-related genes (MRGs; OMIM Ref. No. 601740). Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nu-

clear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces distal-to-proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb. Thorsteinsdottir et al. (2001) identified MEIS1 as a common collaborator with 2 divergent HOX genes, HOXA9 (OMIM Ref. No. 142956) and HOXB3 (OMIM Ref. No. 142966), in leukemic transformation. Using over-expression studies in bone marrow cells, they also demonstrated that each HOX gene studied predisposes to leukemias that are phenotypically distinct and that MEIS1 acts primarily to accelerate the occurrence of these leukemias without altering their phenotype. By fluorescence in situ hybridization, Moskow et al. (1995) mapped the human MEIS1 gene to 2p14-p13 near 3 translocation breakpoints involved in human leukemia. They mapped the murine homolog to mouse 11.

[33888] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [33889] Moskow, J. J.; Bullrich, F.; Huebner, K.; Daar, I. O.; Buchberg, A. M. : Meis1, a PBX1-related homeobox gene involved in myeloid leukemia in BXH-2 mice. *Molec. Cell. Biol.* 15: 5434-5443, 1995. ; and
- [33890] Steelman, S.; Moskow, J. J.; Muzynski, K.; North, C.; Druck, T.; Montgomery, J. C.; Huebner, K.; Daar, I. O.; Buchberg, A. M. : Identification of a conserved family of Meis1-related home.
- [33891] Further studies establishing the function and utilities of MEIS1 are found in John Hopkins OMIM database record ID 601739, and in cited publications numbered 10366-9328 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM\_000262) is another VGAM894 host target gene. NAGA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NAGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE, designated SEQ ID:5803, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33892] Another function of VGAM894 is therefore inhibition of N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM\_000262). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA. Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452) is another VGAM894 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13166, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33893] Another function of VGAM894 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function

of PAICS has been established by previous studies. Schild et al. (1990) used the functional complementation of mutations in *Saccharomyces cerevisiae* to isolate a human cDNA clone complementing the ade-2 (phosphoribosylaminoimidazole carboxylase; EC 4.1.1.21) yeast mutation. The same cDNA also complemented ade-1 (phosphoribosylaminoimidazole succinocarboxamide synthetase; EC 6.3.2.6); thus, this is a bifunctional enzyme. Although these enzymes are encoded by genes on different chromosomes in yeast, their enzymatic activities copurify from chicken livers, and the complementation of both activities by this single cDNA clone suggests that the enzyme is bifunctional in humans. Barton et al. (1991) mapped the gene to chromosome 4 by fusing Chinese hamster ovary (CHO) cells carrying the Ade(-)D mutation with human lymphocytes using inactivated Sendai virus. Two of the isolated subclones contained only the long arm of human chromosome 4 translocated onto a CHO chromosome, thus providing evidence that the gene in question is on 4q. By subjecting 2 of the subclones containing chromosome 4 to BrdU visible light segregation, Barton et al. (1991) demonstrated that all of the isolated purine auxotrophic cell lines showed a loss of 4q. It is noteworthy

thy that this bifunctional enzyme maps to the same general region as the monofunctional enzyme PPAT (OMIM Ref. No. 172450), which catalyzes the first step in the biosynthetic pathway for the production of AMP from phosphoribosylpyrophosphate (PRPP) and maps to 4pter-q21. AIR carboxylase (EC 4.1.1.21)/SAICAR synthetase (EC 6.3.2.6) is a bifunctional enzyme, the activities of which are required for steps 6 and 7, respectively, of purine biosynthesis. Brayton et al. (1994) demonstrated that in the human, as in the chicken, the GPAT gene (OMIM Ref. No. 172450), which catalyzes the first and presumably rate-limiting reaction in purine biosynthesis, is closely linked and divergently transcribed. The intergenic region is approximately 625 bp in the human and 229 bp in the chicken. Although there are several examples for bidirectional transcription in higher eukaryotes, GPAT-AIRC was the first example for bidirectional transcription of tightly coupled genes that are not structurally related but are involved in the same pathway. This may be a eukaryotic equivalent of a prokaryotic operon.

[33894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [33895] Schild, D.; Brake, A. J.; Kiefer, M. C.; Young, D.; Barr, P. J. : Cloning of three human multifunctional de novo purine biosynthetic genes by functional complementation of yeast mutations. *Proc. Nat. Acad. Sci.* 87: 2916–2920, 1990. ; and
- [33896] Brayton, K. A.; Chen, Z.; Zhou, G.; Nagy, P. L.; Gavalas, A.; Trent, J. M.; Deaven, L. L.; Dixon, J. E.; Zalkin, H. : Two genes for de novo purine nucleotide synthesis on human chromosom.
- [33897] Further studies establishing the function and utilities of PAICS are found in John Hopkins OMIM database record ID 172439, and in cited publications numbered 10941–1094 and 4809 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM\_006245) is another VGAM894 host target gene. PPP2R5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP2R5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5D BINDING SITE, designated SEQ ID:12919, to the nucleotide sequence of

VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33898] Another function of VGAM894 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM\_006245), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5D. The function of PPP2R5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM96.SH2 Domain Protein 1A, Duncan's Disease (lymphoproliferative syndrome) (SH2D1A, Accession NM\_002351) is another VGAM894 host target gene. SH2D1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH2D1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH2D1A BINDING SITE, designated SEQ ID:8156, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33899] Another function of VGAM894 is therefore inhibition of SH2 Domain Protein 1A, Duncan's Disease (lymphoproliferative syndrome) (SH2D1A, Accession NM\_002351), a gene which is involved in t cell signaling. inhibits slam self-association. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH2D1A. The function of SH2D1A has been established by previous studies. Sumegi et al. (2000) reported that analysis of 35 families from the XLP Registry revealed 28 different mutations in 34 families: 3 large genomic deletions, 10 small intragenic deletions, 3 splice site, 3 nonsense, and 9 missense mutations. No mutations were found in 25 males, so-called sporadic XLP (males with an XLP phenotype after EBV infection but no family history of XLP), or in 9 patients with chronic active EBV syndrome. The authors found that although EBV infection often resulted in fulminant infectious mononucleosis, it was not necessary for the expression of other manifestations of XLP and correlated poorly with outcome. They interpreted the results as suggesting that unidentified factors, either environmental or genetic (e.g., modifier genes), contribute to the pathogenesis of XLP. Animal model experiments lend further support to

the function of SH2D1A. Wu et al. (2001) generated Sap-deficient mice, which were fertile and had no defects in lymphocyte surface markers or overall morphology. Sap-deficient mice had increased lymphocytic choriomeningitis virus (LCMV)-specific splenic and hepatic T cells and increased gamma-interferon (IFNG; 147570) production compared with their wildtype littermates. All Sap-deficient mice died as a result of hepatotropic LCMV infection, while only 30% of wildtype mice died. In contrast to the increased Ifng production, interleukin-4 (IL4; 147780) production was markedly lower in Sap-deficient mice. Mice with a BALB/c background are normally highly susceptible to infection with the Leishmania major parasite due to poor Ifng production. However, Sap-deficient mice with a BALB/c background produced little Il4 and high levels of Ifng and had lower parasite burdens than wildtype BALB/c mice. This suggested that in the absence of SAP, IL4 gene activation is defective. Lower Il4 expression in Sap-deficient mice correlated with greatly reduced IgE production and reduced basal IgE expression. Wu et al. (2001) proposed that the Sap-deficient mouse model would be a useful tool for dissecting the complex XLP phenotypes.

[33900] It is appreciated that the abovementioned animal model for SH2D1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[33901] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33902] Sumegi, J.; Huang, D.; Lanyi, A.; Davis, J. D.; Seemayer, T. A.; Maeda, A.; Klein, G.; Seri, M.; Wakiguchi, H.; Purtilo, D. T.; Gross, T. G. : Correlation of mutations of the SH2D1A gene and Epstein–Barr virus infection with clinical phenotype and outcome in X–linked lymphoproliferative disease. Blood 96: 3118–3125, 2000. ; and

[33903] Wu, C.; Nguyen, K. B.; Pien, G. C.; Wang, N.; Gullo, C.; Duncan, H.; Sosa, M. R.; Edwards, M. J.; Borrow, P.; Satoskar, A. R.; Sharpe, A. H.; Biron, C. A.; Terhorst, C. : SAP controls T c.

[33904] Further studies establishing the function and utilities of SH2D1A are found in John Hopkins OMIM database record ID 308240, and in sited publications numbered 8594–8597, 8599, 8600–8612, 4213, 8056–8071, 9435–8079, 8770–123 and 8771–8781 listed in the bibliography section hereinbelow, which are also hereby incor–

porated by reference. Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM\_007256) is another VGAM894 host target gene. SLC21A9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A9 BINDING SITE, designated SEQ ID:14127, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33905] Another function of VGAM894 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM\_007256), a gene which is Moderately similar to SLC21A2 prostaglandin transporter. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A9. The function of SLC21A9 has been established by previous studies. By screening human brain cDNAs for the potential to encode proteins that are at least 50 kD, Nagase et al. (1998) isolated an SLC21A9 cDNA, which they called KIAA0880, that

contains a complete coding sequence. The predicted 709-amino acid SLC21A9 protein contains 8 membrane-spanning regions. SLC21A9 shares 42.8% amino acid sequence identity with a rat prostaglandin transporter across 678 residues. RT-PCR followed by ELISA detected SLC21A9 expression in all human tissues examined, with the highest expression in liver, lower expression in lung, ovary, brain, heart, kidney, pancreas, spleen, and testis, and lowest expression in skeletal muscle. Organic anion-transporting polypeptides (OATPs) are a family of multi-specific carriers that mediate the sodium-independent transport of steroid hormone and conjugates, drugs, and numerous anionic endogenous substrates. St-Pierre et al. (2002) investigated whether members of the OATP gene family could mediate fetal-maternal transfer of anionic steroid conjugates in the human placenta. They isolated OATPB (SLC21A9) from a placenta cDNA library. An anti-serum to OATPB detected an 85-kD protein in basal but not apical syncytiotrophoblast membranes. Immunohistochemistry of first-, second-, and third-trimester placenta showed staining in the cytotrophoblast membranes and at the basal surface of the syncytiotrophoblast. Trophoblasts that reacted with an antibody to Ki-67, a proliferation-as-

sociated antigen, expressed lower levels of OATPB. OATPB mRNA levels were measured in isolated trophoblasts under culture conditions that promoted syncytia formation. Real-time quantitative PCR estimated an 8-fold increase in OATPB expression on differentiation to syncytia. Pregnenolone sulfate partially inhibited OATPB-mediated transport of estrone-3-sulfate in an oocyte expression system. The authors concluded that these findings suggested a physiologic role for OATPB in the placental uptake of fetal-derived sulfated steroids

[33906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33907] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355-364, 1998. ; and

[33908] St-Pierre, M. V.; Hagenbuch, B.; Ugele, B.; Meier, P. J.; Stallmach, T. : Characterization of an organic anion-transporting polypeptide (OATP-B) in human placenta. J. Clin. Endocr. Metab.

[33909] Further studies establishing the function and utilities of SLC21A9 are found in John Hopkins OMIM database record ID 604988, and in cited publications numbered 493 and 7097 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcriptional Adaptor 2 (ADA2 homolog, yeast)-like (TADA2L, Accession NM\_001488) is another VGAM894 host target gene. TADA2L BINDING SITE1 and TADA2L BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TADA2L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TADA2L BINDING SITE1 and TADA2L BINDING SITE2, designated SEQ ID:7229 and SEQ ID:28520 respectively, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33910] Another function of VGAM894 is therefore inhibition of Transcriptional Adaptor 2 (ADA2 homolog, yeast)-like (TADA2L, Accession NM\_001488), a gene which is one PCAF histone acetylase complex subunit, and a probable transcriptional adaptor protein. Accordingly, utilities of

VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TADA2L. The function of TADA2L has been established by previous studies. The ability of DNA-bound transcriptional activator proteins to enhance the initiation rate of RNA polymerase II-mediated gene transcription hinges on their potential to interact functionally with the general transcription machinery bound at the basal promoter. Candau et al. (1996) identified expressed sequence tags of possible human homologs of the yeast transcriptional activator proteins ADA2 and GCN5. Full-length cDNAs, designated TADA2L and GCN5L2 (OMIM Ref. No. 602301), were isolated from testis. The predicted 443-amino acid TADA2L protein is 31% identical to the yeast ADA2 protein.

TADA2L was shown to function experimentally as an adaptor in a human cell line. Carter et al. (1997) found that TADA2L is transcribed to varying degrees in all tissue types, but most abundantly in testis. By fluorescence in situ hybridization, they mapped the TADA2L gene to 17q12-q21, proximal to GCN5L2. Ogryzko et al. (1998) found that TADA2L is associated with the P/CAF (OMIM Ref. No. 602303) protein in the PCAF complex. Struhl and Moqtaderi (1998) reviewed the potential roles of the PCAF

complex in transcription.

[33911] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33912] Carter, K. C.; Wang, L.; Shell, B. K.; Zamir, I.; Berger, S. L.; Moore, P. A. : The human transcriptional adaptor genes TADA2L and GCN5L2 colocalize to chromosome 17q12-q21 and display a similar tissue expression pattern. Genomics 40: 497-500, 1997. ; and

[33913] Ogryzko, V. V.; Kotani, T.; Zhang, X.; Schiltz, R. L.; Howard, T.; Yang, X.-J.; Howard, B. H.; Qin, J.; Nakatani, Y. : Histone-like TAFs within the PCAF histone acetylase complex. Cell.

[33914] Further studies establishing the function and utilities of TADA2L are found in John Hopkins OMIM database record ID 602276, and in cited publications numbered 2799-2802 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TRIP15 (Accession NM\_004236) is another VGAM894 host target gene. TRIP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TRIP15 BINDING SITE, designated SEQ ID:10432, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33915] Another function of VGAM894 is therefore inhibition of TRIP15 (Accession NM\_004236), a gene which is a subunit of the COP9 signalosome complex. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP15. The function of TRIP15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM452. Ubiquitin Specific Protease 9, Y Chromosome (fat facets-like Drosophila) (USP9Y, Accession XM\_034147) is another VGAM894 host target gene. USP9Y BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP9Y, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP9Y BINDING SITE, designated SEQ ID:32019, to the nucleotide sequence of VGAM894 RNA, herein designated

VGAM RNA, also designated SEQ ID:3605.

[33916] Another function of VGAM894 is therefore inhibition of Ubiquitin Specific Protease 9, Y Chromosome (fat facets-like *Drosophila*) (USP9Y, Accession XM\_034147), a gene which removes ubiquitin from ubiquitin-conjugated proteins and has a role in spermatogenesis. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP9Y. The function of USP9Y has been established by previous studies. Sun et al. (1999) were the first to trace spermatogenic failure to a point mutation in a Y-linked gene or to a deletion of a single Y-linked gene. They sequenced the AZFa (see OMIM Ref. No. 415000) region of the Y chromosome and identified 2 functional genes previously described: USP9Y and DBY (OMIM Ref. No. 400010). Screening of the 2 genes in 576 infertile and 96 fertile men revealed several sequence variants, most of which appeared to be heritable and of little functional consequence. They found 1 de novo mutation in USP9Y: a 4-bp deletion in the splice donor site, causing an exon to be skipped and protein truncation. This mutation was present in a man with nonobstructive azoospermia, but was absent in his fertile brother, suggesting that the

USP9Y mutation caused spermatogenic failure. Sun et al. (1999) also identified a single gene deletion associated with spermatogenic failure, again involving USP9Y, by re-analyzing a published study. The coding regions of the DFFRY and DFFRX genes show 89% identity at the nucleotide level. In common with DFFRX, the potential amino acid sequence of DFFRY contains the conserved cysteine and histidine domains characteristic of ubiquitin C-terminal hydrolases. The human DFFRY mRNA is expressed in a wide range of adult and embryonic tissues, including testis, whereas the homologous mouse Dffry gene is expressed specifically in the testis. Brown et al. (1998) found that 3 azoospermic male patients had deletion of DFFRY from the Y chromosome. Two patients had a testicular phenotype that resembled Sertoli cell-only syndrome (see OMIM Ref. No. 305700), and the third had diminished spermatogenesis. In all 3 patients, the deletions extended from close to the 3-prime end into the gene, removing the entire coding sequence of DFFRY. Brown et al. (1998) showed that the mouse Dffry gene maps to the Sxr-b deletion interval on the shorter arm of the mouse Y chromosome and that its expression in mouse testis can first be detected between 7.5 and 10.5 days after birth when

type A and B spermatogonia and preleptotene and leptotene spermatocytes are present.

[33917] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[33918] Sun, C.; Skaletsky, H.; Birren, B.; Devon, K.; Tang, Z.; Silber, S.; Oates, R.; Page, D. C. : An azoospermic man with a de novo point mutation in the Y-chromosomal gene USP9Y. *Nature Genet.* 23: 429–432, 1999. ; and

[33919] Brown, G. M.; Furlong, R. A.; Sargent, C. A.; Erickson, R. P.; Longepied, G.; Mitchell, M.; Jones, M. H.; Hargreave, T. B.; Cooke, H. J.; Affara, N. A. : Characterisation of the coding.

[33920] Further studies establishing the function and utilities of USP9Y are found in John Hopkins OMIM database record ID 400005, and in cited publications numbered 8827–882 and 9087–8833 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Zinc–fingers and Homeoboxes 1 (ZHX1, Accession NM\_007222) is another VGAM894 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus–

trates the complementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:14092, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33921] Another function of VGAM894 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM\_007222). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803) is another VGAM894 host target gene. AP3M2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP3M2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3M2 BINDING SITE, designated SEQ ID:13678, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33922] Another function of VGAM894 is therefore inhibition of Adaptor-related Protein Complex 3, Mu 2 Subunit (AP3M2, Accession NM\_006803). Accordingly, utilities of

VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3M2. Chromosome 8 Open Reading Frame 17 (C8orf17, Accession NM\_020237) is another VGAM894 host target gene. C8orf17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf17 BINDING SITE, designated SEQ ID:21506, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33923] Another function of VGAM894 is therefore inhibition of Chromosome 8 Open Reading Frame 17 (C8orf17, Accession NM\_020237). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf17. DKFZP434J1813 (Accession XM\_029798) is another VGAM894 host target gene. DKFZP434J1813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J1813, corresponding to a HOST TARGET binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J1813 BINDING SITE, designated SEQ ID:30950, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33924] Another function of VGAM894 is therefore inhibition of DKFZP434J1813 (Accession XM\_029798). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J1813. FLJ10520 (Accession NM\_018124) is another VGAM894 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19908, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33925] Another function of VGAM894 is therefore inhibition of FLJ10520 (Accession NM\_018124). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520.

FLJ13449 (Accession NM\_024546) is another VGAM894 host target gene. FLJ13449 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13449 BINDING SITE, designated SEQ ID:23760, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33926] Another function of VGAM894 is therefore inhibition of FLJ13449 (Accession NM\_024546). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13449. FLJ13842 (Accession NM\_024645) is another VGAM894 host target gene. FLJ13842 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13842 BINDING SITE, designated SEQ ID:23930, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3605.

[33927] Another function of VGAM894 is therefore inhibition of FLJ13842 (Accession NM\_024645). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13842. Glia Maturation Factor, Beta (GMFB, Accession NM\_004124) is another VGAM894 host target gene. GMFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GMFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:10331, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33928] Another function of VGAM894 is therefore inhibition of Glia Maturation Factor, Beta (GMFB, Accession NM\_004124). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB. HCA127 (Accession NM\_018684) is another VGAM894 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

HCA127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20761, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33929] Another function of VGAM894 is therefore inhibition of HCA127 (Accession NM\_018684). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. HMP19 (Accession XM\_113455) is another VGAM894 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:42274, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33930] Another function of VGAM894 is therefore inhibition of HMP19 (Accession XM\_113455). Accordingly, utilities of

VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19. ICK (Accession NM\_014920) is another VGAM894 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17198, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33931] Another function of VGAM894 is therefore inhibition of ICK (Accession NM\_014920). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. KIAA0057 (Accession NM\_012288) is another VGAM894 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14623, to the nucleotide sequence of

VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33932] Another function of VGAM894 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0319 (Accession NM\_014809) is another VGAM894 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16765, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33933] Another function of VGAM894 is therefore inhibition of KIAA0319 (Accession NM\_014809). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0354 (Accession NM\_014872) is another VGAM894 host target gene. KIAA0354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0354 BINDING SITE, designated SEQ ID:17000, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33934] Another function of VGAM894 is therefore inhibition of KIAA0354 (Accession NM\_014872). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354. KIAA0703 (Accession NM\_014861) is another VGAM894 host target gene. KIAA0703 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0703 BINDING SITE, designated SEQ ID:16930, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33935] Another function of VGAM894 is therefore inhibition of KIAA0703 (Accession NM\_014861). Accordingly, utilities

of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0703. KIAA0961 (Accession NM\_014898) is another VGAM894 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17074, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33936] Another function of VGAM894 is therefore inhibition of KIAA0961 (Accession NM\_014898). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. KIAA1257 (Accession XM\_031577) is another VGAM894 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1257 BINDING SITE, designated SEQ ID:31442, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33937] Another function of VGAM894 is therefore inhibition of KIAA1257 (Accession XM\_031577). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. KIAA1500 (Accession XM\_034353) is another VGAM894 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32072, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33938] Another function of VGAM894 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. MIC2 Like 1 (MIC2L1, Accession NM\_031462) is another VGAM894 host target gene. MIC2L1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25493, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33939] Another function of VGAM894 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM\_031462). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. MR (Accession NM\_031212) is another VGAM894 host target gene. MR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MR BINDING SITE, designated SEQ ID:25257, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33940] Another function of VGAM894 is therefore inhibition of

MR (Accession NM\_031212). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MR. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM894 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30146, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33941] Another function of VGAM894 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718) is another VGAM894 host target gene. PPP2R3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PPP2R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R3A BINDING SITE, designated SEQ ID:8587, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33942] Another function of VGAM894 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM\_002718). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R3A. SENP7 (Accession NM\_020654) is another VGAM894 host target gene. SENP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SENP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SENP7 BINDING SITE, designated SEQ ID:21823, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33943] Another function of VGAM894 is therefore inhibition of

SENP7 (Accession NM\_020654). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SENP7. Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM\_004768) is another VGAM894 host target gene. SFRS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS11 BINDING SITE, designated SEQ ID:11160, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33944] Another function of VGAM894 is therefore inhibition of Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM\_004768). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS11. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM\_003184) is another VGAM894 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:9160, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33945] Another function of VGAM894 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM\_003184). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. Zinc Metalloprotease (STE24 homolog, yeast) (ZMPSTE24, Accession NM\_005857) is another VGAM894 host target gene. ZMPSTE24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZMPSTE24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZMPSTE24 BINDING SITE, designated SEQ ID:12463, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ

ID:3605.

[33946] Another function of VGAM894 is therefore inhibition of Zinc Metalloproteinase (STE24 homolog, yeast) (ZMPSTE24, Accession NM\_005857). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZMP-STE24. Zinc Finger Protein 262 (ZNF262, Accession NM\_005095) is another VGAM894 host target gene. ZNF262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF262 BINDING SITE, designated SEQ ID:11558, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33947] Another function of VGAM894 is therefore inhibition of Zinc Finger Protein 262 (ZNF262, Accession NM\_005095). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF262. LOC147991 (Accession XM\_085993) is another VGAM894 host target gene.

LOC147991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38438, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33948] Another function of VGAM894 is therefore inhibition of LOC147991 (Accession XM\_085993). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. LOC149271 (Accession XM\_086475) is another VGAM894 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38682, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33949] Another function of VGAM894 is therefore inhibition of LOC149271 (Accession XM\_086475). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC150170 (Accession XM\_086799) is another VGAM894 host target gene. LOC150170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150170 BINDING SITE, designated SEQ ID:38864, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33950] Another function of VGAM894 is therefore inhibition of LOC150170 (Accession XM\_086799). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150170. LOC150175 (Accession XM\_086806) is another VGAM894 host target gene. LOC150175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150175, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150175 BINDING SITE, designated SEQ ID:38886, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33951] Another function of VGAM894 is therefore inhibition of LOC150175 (Accession XM\_086806). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150175. LOC150215 (Accession XM\_086813) is another VGAM894 host target gene. LOC150215 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150215 BINDING SITE, designated SEQ ID:38890, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33952] Another function of VGAM894 is therefore inhibition of LOC150215 (Accession XM\_086813). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150215. LOC150218 (Accession XM\_086850) is another VGAM894 host target gene. LOC150218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150218 BINDING SITE, designated SEQ ID:38917, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33953] Another function of VGAM894 is therefore inhibition of LOC150218 (Accession XM\_086850). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150218. LOC151201 (Accession XM\_098021) is another VGAM894 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41325, to the nucleotide sequence of VGAM894 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3605.

[33954] Another function of VGAM894 is therefore inhibition of LOC151201 (Accession XM\_098021). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC206338 (Accession XM\_116456) is another VGAM894 host target gene. LOC206338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206338 BINDING SITE, designated SEQ ID:43112, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33955] Another function of VGAM894 is therefore inhibition of LOC206338 (Accession XM\_116456). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206338. LOC221576 (Accession XM\_168088) is another VGAM894 host target gene. LOC221576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221576, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221576 BINDING SITE, designated SEQ ID:45001, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33956] Another function of VGAM894 is therefore inhibition of LOC221576 (Accession XM\_168088). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221576. LOC257282 (Accession XM\_172844) is another VGAM894 host target gene. LOC257282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257282 BINDING SITE, designated SEQ ID:46123, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33957] Another function of VGAM894 is therefore inhibition of LOC257282 (Accession XM\_172844). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257282. LOC257515 (Accession XM\_175211) is another VGAM894 host target gene. LOC257515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257515 BINDING SITE, designated SEQ ID:46685, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33958] Another function of VGAM894 is therefore inhibition of LOC257515 (Accession XM\_175211). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257515. LOC257572 (Accession XM\_175294) is another VGAM894 host target gene. LOC257572 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257572 BINDING SITE, designated SEQ ID:46746, to

the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33959] Another function of VGAM894 is therefore inhibition of LOC257572 (Accession XM\_175294). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257572. LOC91445 (Accession XM\_018516) is another VGAM894 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30369, to the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, also designated SEQ ID:3605.

[33960] Another function of VGAM894 is therefore inhibition of LOC91445 (Accession XM\_018516). Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 895 (VGAM895) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[33961] VGAM895 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM895 was detected is described hereinabove with reference to Figs. 1–8.

[33962] VGAM895 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[33963] VGAM895 gene encodes a VGAM895 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM895 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM895 precursor RNA is designated SEQ ID:881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:881 is located at position 20248 relative to the genome of Gallid Herpesvirus 2.

[33964] VGAM895 precursor RNA folds onto itself, forming VGAM895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33965] An enzyme complex designated DICER COMPLEX, `dices` the VGAM895 folded precursor RNA into VGAM895 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM895 RNA is designated SEQ ID:3606, and is provided hereinbelow with reference to the sequence listing part.

[33966] VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM895 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM895 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33967] VGAM895 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM895 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM895 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33968] The complementary binding of VGAM895 RNA, herein designated VGAM RNA, to host target binding sites on VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM895 host target RNA into VGAM895 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33969] It is appreciated that VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM895 host target genes. The mRNA of each one of this plurality of VGAM895 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM895 RNA, herein designated VGAM RNA, and which when bound by VGAM895 RNA causes inhibition of translation of respective one or more VGAM895 host target proteins.

[33970] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM895 gene, herein designated VGAM GENE, on one or more VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[33971] It is yet further appreciated that a function of VGAM895 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM895 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM895 correlate with, and may be deduced from, the identity of the

host target genes which VGAM895 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33972] Nucleotide sequences of the VGAM895 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM895 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM895 are further described hereinbelow with reference to Table 1.

[33973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM895 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM895 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[33974] As mentioned hereinabove with reference to Fig. 1, a function of VGAM895 gene, herein designated VGAM is inhibition of expression of VGAM895 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM895 correlate with, and may be deduced from, the identity of the target genes which VGAM895

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33975] KOC1 (Accession XM\_165847) is a VGAM895 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE, designated SEQ ID:43781, to the nucleotide sequence of VGAM895 RNA, herein designated VGAM RNA, also designated SEQ ID:3606.

[33976] A function of VGAM895 is therefore inhibition of KOC1 (Accession XM\_165847). Accordingly, utilities of VGAM895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KOC1. SE57-1 (Accession NM\_025214) is another VGAM895 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24890, to the nucleotide sequence of VGAM895

RNA, herein designated VGAM RNA, also designated SEQ ID:3606.

- [33977] Another function of VGAM895 is therefore inhibition of SE57-1 (Accession NM\_025214). Accordingly, utilities of VGAM895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 896 (VGAM896) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [33978] VGAM896 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM896 was detected is described hereinabove with reference to Figs. 1-8.
- [33979] VGAM896 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [33980] VGAM896 gene encodes a VGAM896 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM896 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM896 precursor RNA is designated SEQ ID:882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:882 is located at position 21611 relative to the genome of Gallid Herpesvirus 2.

[33981] VGAM896 precursor RNA folds onto itself, forming VGAM896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[33982] An enzyme complex designated DICER COMPLEX, `dices` the VGAM896 folded precursor RNA into VGAM896 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM896 RNA is designated SEQ ID:3607, and is provided hereinbelow with reference to the sequence listing part.

[33983] VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM896 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[33984] VGAM896 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM896 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM896 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[33985] The complementary binding of VGAM896 RNA, herein designated VGAM RNA, to host target binding sites on VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM896 host target RNA into VGAM896 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[33986] It is appreciated that VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM896 host target genes. The mRNA of

each one of this plurality of VGAM896 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM896 RNA, herein designated VGAM RNA, and which when bound by VGAM896 RNA causes inhibition of translation of respective one or more VGAM896 host target proteins.

[33987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM896 gene, herein designated VGAM GENE, on one or more VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[33988] It is yet further appreciated that a function of VGAM896 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM896 correlate with, and may be deduced from, the identity of the host target genes which VGAM896 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[33989] Nucleotide sequences of the VGAM896 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM896 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM896 are further described hereinbelow with reference to Table 1.

[33990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM896 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM896 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[33991] As mentioned hereinabove with reference to Fig. 1, a function of VGAM896 gene, herein designated VGAM is inhibition of expression of VGAM896 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM896 correlate with, and may be deduced from, the identity of the target genes which VGAM896 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[33992] B-cell CLL/lymphoma 9 (BCL9, Accession NM\_004326) is a VGAM896 host target gene. BCL9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE, designated SEQ ID:10521, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33993] A function of VGAM896 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM\_004326), a gene which recruits of PYGO to the nuclear beta-catenin-TCF

complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806) is another VGAM896 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31137, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33994] Another function of VGAM896 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM416. Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261) is another VGAM896 host target gene. C20orf103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE, designated SEQ ID:14567, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33995] Another function of VGAM896 is therefore inhibition of Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261). Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM\_021815) is another VGAM896 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22392, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33996] Another function of VGAM896 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM\_021815). Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. LOC197201 (Accession XM\_113839) is another VGAM896 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42462, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33997] Another function of VGAM896 is therefore inhibition of LOC197201 (Accession XM\_113839). Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC254122 (Accession XM\_170660) is another VGAM896 host target gene. LOC254122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254122 BINDING SITE, designated SEQ ID:45434, to the nucleotide sequence of VGAM896 RNA, herein designated VGAM RNA, also designated SEQ ID:3607.

[33998] Another function of VGAM896 is therefore inhibition of LOC254122 (Accession XM\_170660). Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254122. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 897 (VGAM897) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[33999] VGAM897 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM897 was detected is described hereinabove with reference to Figs. 1–8.

[34000] VGAM897 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34001] VGAM897 gene encodes a VGAM897 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM897 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM897 precursor RNA is designated SEQ ID:883, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:883 is located at position 20974 relative to the genome of Gallid Herpesvirus 2.

[34002] VGAM897 precursor RNA folds onto itself, forming VGAM897 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[34003] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM897 folded precursor RNA into VGAM897 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 59%) nucleotide se-  
quence of VGAM897 RNA is designated SEQ ID:3608, and  
is provided hereinbelow with reference to the sequence  
listing part.

[34004] VGAM897 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM897 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM897 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34005] VGAM897 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM897 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM897 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34006] The complementary binding of VGAM897 RNA, herein designated VGAM RNA, to host target binding sites on VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM897 host target RNA into VGAM897 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34007] It is appreciated that VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM897 host target genes. The mRNA of each one of this plurality of VGAM897 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM897 RNA, herein designated VGAM RNA, and which when bound by VGAM897 RNA causes inhibition of translation of respective one or more VGAM897 host target proteins.

[34008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM897 gene, herein designated VGAM GENE, on one or more VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34009] It is yet further appreciated that a function of VGAM897 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM897 correlate with, and may be deduced from, the identity of the host target genes which VGAM897 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[34010] Nucleotide sequences of the VGAM897 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM897 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM897 are further described hereinbelow with reference to Table 1.

[34011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM897 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM897 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34012] As mentioned hereinabove with reference to Fig. 1, a function of VGAM897 gene, herein designated VGAM is inhibition of expression of VGAM897 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM897 correlate with, and may be deduced from, the identity of the target genes which VGAM897 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34013] Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453) is a VGAM897 host target gene. CLASP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP2 BINDING SITE, designated SEQ ID:32269, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34014] A function of VGAM897 is therefore inhibition of Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453), a gene which is involved in the regional regulation of microtubule dynamics in motile fibroblasts. Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP2. The function of CLASP2 has been established by previous studies. CLIP170 (OMIM Ref. No. 179838) and CLIP115 (OMIM Ref. No. 603432) are cytoplasmic linker proteins that associate specifically with the ends of growing microtubules and may act as anticrotrophe factors. Using a yeast 2-hybrid screen with an N-terminal region of CLIP115 as bait, followed by cDNA li-

brary screening, RACE analysis, and EST database searching, Akhmanova et al. (2001) identified mouse and human cDNAs encoding 2 CLIP-associated proteins, CLASP1 (OMIM Ref. No. 605852) and CLASP2. The CLASPs are homologous to a *Drosophila* microtubule-associated protein termed Orbit or Mast. CLASP1 is identical to the protein encoded by a partial cDNA, KIAA0622, identified by Ishikawa et al. (1998), although the KIAA0622 protein lacks the N-terminal 249 amino acids of the 1,538-amino acid CLASP1 protein reported by Akhmanova et al. (2001). CLASP2 shares approximately 75% identity with the KIAA0627 protein, which is encoded by a partial cDNA also identified by Ishikawa et al. (1998). There are several CLASP isoforms due to alternative splicing. Northern blot analysis of mouse tissues detected highest expression of Clasp1 in brain, heart, and testis, while Clasp2 mRNAs were enriched in the brain. The Clasp2-beta transcript appeared to be brain specific. By RT-PCR analysis, Ishikawa et al. (1998) detected variable but ubiquitous expression of CLASP2, or KIAA0627, except in spleen. Akhmanova et al. (2001) showed that CLASPs bind CLIPs and microtubules, colocalize with the CLIPs at microtubule distal ends, and have microtubule-stabilizing effects in

transfected cells. After serum induction, CLASPs relocate to distal segments of microtubules at the leading edge of motile fibroblasts. Akhmanova et al. (2001) provided evidence that this asymmetric CLASP distribution is mediated by phosphatidylinositol 3-kinase (see OMIM Ref. No. 171834) and glycogen synthase kinase 3-beta (OMIM Ref. No. 605004). Antibody injections suggested that CLASP2 is required for the orientation of stabilized microtubules toward the leading edge. The authors proposed that CLASPs are involved in the local regulation of microtubule dynamics in response to positional cues.

[34015] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34018] Further studies establishing the function and utilities of CLASP2 are found in John Hopkins OMIM database record ID 605853, and in cited publications numbered 662 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fucosyltransferase 1 (galactoside 2-alpha-L-fucosyltransferase, Bombay phenotype included) (FUT1, Accession NM\_000148) is another VGAM897 host target gene. FUT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT1 BINDING SITE, designated SEQ ID:5645, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34019] Another function of VGAM897 is therefore inhibition of Fucosyltransferase 1 (galactoside 2-alpha-L-fucosyltransferase, Bombay phenotype included) (FUT1, Accession NM\_000148). Accordingly, utilities of VGAM897 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with FUT1. Nuclear Receptor Subfamily 4, Group A, Member 1 (NR4A1, Accession NM\_002135) is another VGAM897 host target gene. NR4A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A1 BINDING SITE, designated SEQ ID:7911, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34020] Another function of VGAM897 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 1 (NR4A1, Accession NM\_002135), a gene which is a member of steroid receptor family and binds DNA. Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A1. The function of NR4A1 has been established by previous studies. Ryseck et al. (1989) characterized a growth factor-inducible gene, N10, encoding a nuclear protein of 601 amino acids with similarities to members of the steroid and thyroid hormone receptor families. The

gene is rapidly but transiently induced by several mitogens. The N10 transcription unit is 8 kb long and split into 7 exons. The exon–intron distribution is similar to that of other members of the nuclear receptor superfamily. The gene was assigned to mouse chromosome 15 and human chromosome 12 (12q13) by in situ hybridization. These localizations are close to that of the gene encoding gamma retinoic acid receptor (OMIM Ref. No. 180190). Chang et al. (1989) isolated a member of the steroid receptor superfamily, which they called TR3, from a human prostate cDNA library by use of an oligonucleotide probe to the DNA–binding domain common to members of the steroid receptor superfamily. Sequence analysis of the TR3 cDNA revealed that it encodes a 598–amino acid protein with domains homologous to the DNA–binding and hormone–binding domains of other members of the steroid receptor superfamily. Chang et al. (1989) found that the TR3 receptor shares about 20% amino acid homology with the estrogen receptor and less than 15% homology with other known receptors. The authors noted that the TR3 gene may be the human homolog of the mouse nur77 gene, with which it shares 91% amino acid identity. Expression of the TR3 cDNA in rabbit reticulocyte lysate

produced a 64-kD DNA-binding protein.

[34021] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34022] Chang, C.; Kokontis, J.; Liao, S. S.; Chang, Y. : Isolation and characterization of human TR3 receptor: a member of steroid receptor superfamily. J. Steroid Biochem. 34: 391-395, 1989. ; and

[34023] Ryseck, R.-P.; Macdonald-Bravo, H.; Mattei, M. G.; Siegfried, R. L.; Bravo, R. : Structure, mapping and expression of a growth factor inducible gene encoding a putative nuclear hormonal.

[34024] Further studies establishing the function and utilities of NR4A1 are found in John Hopkins OMIM database record ID 139139, and in cited publications numbered 4728-4737 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 17 (TNFRSF17, Accession NM\_001192) is another VGAM897 host target gene. TNFRSF17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNFRSF17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF17 BINDING SITE, designated SEQ ID:6862, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34025] Another function of VGAM897 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 17 (TNFRSF17, Accession NM\_001192), a gene which associates with B lymphocyte maturation. Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF17. The function of TNFRSF17 has been established by previous studies. Laabi et al. (1992) found that a t(4;16)(q26;p13.1) translocation, found in tumor cells of a patient with intestinal T-cell lymphoma, resulted in a rearrangement of the interleukin-2 gene (IL2; 147680), normally located on 4q26, with sequences from 16p13.1. Use of an IL2-specific probe to screen a cDNA library of tumor cells, Laabi et al. (1992) isolated clones that consisted, from 5-prime to 3-prime, of the 3 first exons of the IL2 gene, followed by a 16p13 in-frame sequence encoding 181 amino acids. A probe derived from this sequence detected a 1.2-kb transcript in various cell lines exhibiting

mature B lymphoid cell features, but this sequence was not detected in other cell lines representative of other hematopoietic lineages, or in other organs. For this reason, the novel gene was termed BCM for B-cell maturation. The open reading frame of normal BCM cDNA predicted a 184-amino acid protein with a single transmembrane domain that had no homology with any protein sequences stored in data banks. Data indicated that the expression of BCM coincides with B-cell terminal maturation. Gras et al. (1995) found that in a myeloma cell line, BCMA is primarily expressed in a perinuclear Golgi-like structure. By transfection of kidney and B-cell lines and flow cytometry and immunofluorescence analysis, Hatzoglou et al. (2000) demonstrated that in addition to the intracytoplasmic localization, BCMA is present on the cell surface. Western blot analysis showed that overexpressed BCMA, like other TNFRs, induces activation of NF $\kappa$ B (OMIM Ref. No. 164011) as well as the MAPK substrate ELK1 (OMIM Ref. No. 311040) and the MAPKs JNK (MAPK8; 601158) and p38 (MAPK14; 600289), but not ERK (OMIM Ref. No. 600997), via its cytoplasmic tail (residues 119 to 143). Cotransfection, immunoprecipitation, and immunoblot analysis indicated that BCMA, again through its cytoplas-

mic tail, associates with TRAF1 601711, TRAF2 601895, and TRAF3 601896, but not with TRAF5 602356, suggesting that these adaptor proteins further propagate signals elicited by TNFRs such as BCMA.

[34026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34027] Laabi, Y.; Gras, M. P.; Carbonnel, F.; Brouet, J. C.; Berger, R.; Larsen, C. J.; Tsapis, A. : A new gene, BCM, on chromosome 16 is fused to the interleukin 2 gene by a t(4;16)(q26;p13) translocation in a malignant T cell lymphoma. EMBO J. 11: 3897–3904, 1992. ; and

[34028] Hatzoglou, A.; Roussel, J.; Bourgeade, M.–F.; Rogier, E.; Madry, C.; Inoue, J.; Devergne, O.; Tsapis, A. : TNF receptor family member BCMA (B cell maturation) associates with TNF recepto.

[34029] Further studies establishing the function and utilities of TNFRSF17 are found in John Hopkins OMIM database record ID 109545, and in cited publications numbered 50 and 3161 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C–C motif) Receptor 6 (CCR6, Accession NM\_031409) is another VGAM897 host target gene. CCR6

BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE, designated SEQ ID:25371, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34030] Another function of VGAM897 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM\_005822) is another VGAM897 host target gene. DSCR1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1L1 BINDING SITE, designated SEQ ID:12430, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ

ID:3608.

[34031] Another function of VGAM897 is therefore inhibition of Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM\_005822). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1L1.

FLJ10826 (Accession NM\_018233) is another VGAM897 host target gene. FLJ10826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10826 BINDING SITE, designated SEQ ID:20174, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34032] Another function of VGAM897 is therefore inhibition of FLJ10826 (Accession NM\_018233). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10826. FLJ12888 (Accession NM\_024945) is another VGAM897 host target gene. FLJ12888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ12888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12888 BINDING SITE, designated SEQ ID:24497, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34033] Another function of VGAM897 is therefore inhibition of FLJ12888 (Accession NM\_024945). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12888. Golgi Phosphoprotein 2 (GOLPH2, Accession NM\_016548) is another VGAM897 host target gene. GOLPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH2 BINDING SITE, designated SEQ ID:18623, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34034] Another function of VGAM897 is therefore inhibition of Golgi Phosphoprotein 2 (GOLPH2, Accession NM\_016548).

Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH2. LOC168667 (Accession XM\_166592) is another VGAM897 host target gene. LOC168667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:44568, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34035] Another function of VGAM897 is therefore inhibition of LOC168667 (Accession XM\_166592). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667. LOC204010 (Accession XM\_115138) is another VGAM897 host target gene. LOC204010 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC204010 BINDING SITE, designated SEQ ID:43082, to the nucleotide sequence of VGAM897 RNA, herein designated VGAM RNA, also designated SEQ ID:3608.

[34036] Another function of VGAM897 is therefore inhibition of LOC204010 (Accession XM\_115138). Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204010. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 898 (VGAM898) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34037] VGAM898 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM898 was detected is described hereinabove with reference to Figs. 1–8.

[34038] VGAM898 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Mottle Virus. VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[34039] VGAM898 gene encodes a VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM898 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM898 precursor RNA is designated SEQ ID:884, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:884 is located at position 3264 relative to the genome of Cowpea Mottle Virus.

[34040] VGAM898 precursor RNA folds onto itself, forming VGAM898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34041] An enzyme complex designated DICER COMPLEX, `dices` the VGAM898 folded precursor RNA into VGAM898 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM898 RNA is designated SEQ ID:3609, and is provided hereinbelow with reference to the sequence listing part.

[34042] VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM898 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34043] VGAM898 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM898 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM898 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34044] The complementary binding of VGAM898 RNA, herein designated VGAM RNA, to host target binding sites on VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM898 host target RNA into VGAM898 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34045] It is appreciated that VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM898 host target genes. The mRNA of each one of this plurality of VGAM898 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM898 RNA, herein designated VGAM RNA, and which when bound by VGAM898 RNA causes inhibition of translation of respective one or more VGAM898 host target proteins.

[34046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM898 gene, herein designated VGAM GENE, on one or more VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34047] It is yet further appreciated that a function of VGAM898 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of viral infection by Cowpea Mottle Virus. Specific functions, and accordingly utilities, of VGAM898 correlate with, and may be deduced from, the identity of the host target genes which VGAM898 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34048] Nucleotide sequences of the VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM898 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM898 are further described hereinbelow with reference to Table 1.

[34049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM898 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM898 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34050] As mentioned hereinabove with reference to Fig. 1, a function of VGAM898 gene, herein designated VGAM is inhibition of expression of VGAM898 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM898 correlate with, and may be deduced from, the identity of the target genes which VGAM898 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34051] DKFZP564O0423 (Accession XM\_166254) is a VGAM898 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44069, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34052] A function of VGAM898 is therefore inhibition of DKFZP564O0423 (Accession XM\_166254). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FLJ14251 (Accession NM\_024881) is another VGAM898 host target gene. FLJ14251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14251 BINDING SITE, designated SEQ ID:24322, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34053] Another function of VGAM898 is therefore inhibition of FLJ14251 (Accession NM\_024881). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14251. FLJ32743 (Accession NM\_145020) is another VGAM898 host target gene. FLJ32743 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ32743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32743 BINDING SITE, designated SEQ ID:29628, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34054] Another function of VGAM898 is therefore inhibition of FLJ32743 (Accession NM\_145020). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32743. MGC20486 (Accession NM\_052844) is another VGAM898 host target gene. MGC20486 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20486 BINDING SITE, designated SEQ ID:27423, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34055] Another function of VGAM898 is therefore inhibition of MGC20486 (Accession NM\_052844). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC20486. Zinc Finger Protein 226 (ZNF226, Accession NM\_016444) is another VGAM898 host target gene. ZNF226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF226 BINDING SITE, designated SEQ ID:18564, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34056] Another function of VGAM898 is therefore inhibition of Zinc Finger Protein 226 (ZNF226, Accession NM\_016444). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF226. LOC151614 (Accession XM\_087252) is another VGAM898 host target gene. LOC151614 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151614 BINDING SITE, desig-

nated SEQ ID:39141, to the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, also designated SEQ ID:3609.

[34057] Another function of VGAM898 is therefore inhibition of LOC151614 (Accession XM\_087252). Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151614. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 899 (VGAM899) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34058] VGAM899 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM899 was detected is described hereinabove with reference to Figs. 1–8.

[34059] VGAM899 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 2. VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34060] VGAM899 gene encodes a VGAM899 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM899 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM899 precursor RNA is designated SEQ ID:885, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:885 is located at position 46153 relative to the genome of Human Herpesvirus 2.

[34061] VGAM899 precursor RNA folds onto itself, forming VGAM899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34062] An enzyme complex designated DICER COMPLEX, `dices` the VGAM899 folded precursor RNA into VGAM899 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM899 RNA is designated SEQ ID:3610, and is provided hereinbelow with reference to the sequence listing part.

[34063] VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM899 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34064] VGAM899 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM899 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM899 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34065] The complementary binding of VGAM899 RNA, herein designated VGAM RNA, to host target binding sites on VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM899 host target RNA into VGAM899 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34066] It is appreciated that VGAM899 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM899 host target genes. The mRNA of each one of this plurality of VGAM899 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM899 RNA, herein designated VGAM RNA, and which when bound by VGAM899 RNA causes inhibition of translation of respective one or more VGAM899 host target proteins.

[34067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM899 gene, herein designated VGAM GENE, on one or more VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[34068] It is yet further appreciated that a function of VGAM899 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM899 correlate with, and may be deduced from, the identity of the host target genes which VGAM899 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34069] Nucleotide sequences of the VGAM899 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM899 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM899 are further described hereinbelow with reference to Table 1.

[34070] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM899 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM899 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34071] As mentioned hereinabove with reference to Fig. 1, a function of VGAM899 gene, herein designated VGAM is inhibition of expression of VGAM899 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM899 correlate with, and may be deduced from, the identity of the target genes which VGAM899 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34072] Aquaporin 6, Kidney Specific (AQP6, Accession NM\_001652) is a VGAM899 host target gene. AQP6 BINDING SITE1 and AQP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AQP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 and AQP6 BINDING SITE2, designated SEQ ID:7358 and SEQ ID:27612 respectively, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ

ID:3610.

[34073] A function of VGAM899 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM\_001652), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Calcium Channel, Voltage-dependent, P/Q Type, Alpha 1A Subunit (CACNA1A, Accession NM\_000068) is another VGAM899 host target gene. CACNA1A BINDING SITE1 and CACNA1A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CACNA1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1A BINDING SITE1 and CACNA1A BINDING SITE2, designated SEQ ID:5515 and SEQ ID:35106 respectively, to the nucleotide sequence of VGAM899 RNA, herein designated

VGAM RNA, also designated SEQ ID:3610.

[34074] Another function of VGAM899 is therefore inhibition of Calcium Channel, Voltage-dependent, P/Q Type, Alpha 1A Subunit (CACNA1A, Accession NM\_000068). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1A. G Protein-coupled Receptor 62 (GPR62, Accession XM\_116151) is another VGAM899 host target gene. GPR62 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR62, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR62 BINDING SITE, designated SEQ ID:43109, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34075] Another function of VGAM899 is therefore inhibition of G Protein-coupled Receptor 62 (GPR62, Accession XM\_116151). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR62. Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Ac-

cession NM\_012434) is another VGAM899 host target gene. SLC17A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A5 BINDING SITE, designated SEQ ID:14812, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34076] Another function of VGAM899 is therefore inhibition of Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Accession NM\_012434), a gene which is a member of a family of anion/cation symporters. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A5. The function of SLC17A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766. Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM\_004613) is another VGAM899 host target gene. TGM2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM2 BINDING SITE, designated SEQ ID:10953, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34077] Another function of VGAM899 is therefore inhibition of Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM\_004613), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to proteins. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGM2. The function of TGM2 has been established by previous studies. Transglutaminases (EC 2.3.2.13) are a family of enzymes that catalyze the crosslinking of proteins by epsilon-gamma glutamyl lysine isopeptide bonds. The transglutaminases include factor XIII (plasma transglutaminase; 134570), keratinocyte transglutaminase (TGM1; 190195), hair follicle transglutaminase, prostate transglutaminase (TGM4; 600585), and

tissue transglutaminase (TGM2). Although the overall primary structures of these enzymes appear to be quite different, they all share a common amino acid sequence at the active site (Y-G-Q-C-W) and a strict calcium dependence for their activity. The differences in the primary structures of these different transglutaminases are probably responsible for the diverse biologic functions that they play in physiologic processes such as blood coagulation, epidermal differentiation, seminal fluid coagulation and fertilization, cell differentiation, and apoptosis. Dieterich et al. (1997) demonstrated that tissue transglutaminase is the autoantigen involved in celiac disease (OMIM Ref. No. 212750). Gentile et al. (1991) isolated mouse and human cDNAs encoding tissue transglutaminase. The predicted 687-amino acid human protein is 84% and 81% identical to mouse and guinea pig tissue transglutaminase, respectively. In vitro translated human tissue transglutaminase has an apparent molecular mass of 85 kD by SDS-PAGE. The translated product exhibited calcium-dependent catalytic activity. Northern blot analysis revealed that tissue transglutaminase is expressed as a 3.6-kb mRNA in human endothelial cells. Lu et al. (1995) cloned the promoter region of TGM2, ligated it to a reporter construct,

and demonstrated its activity in transient transfection experiments.

[34078] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34079] Dieterich, W.; Ehnis, T.; Bauer, M.; Donner, P.; Volta, U.; Riecken, E. O.; Schuppan, D. : Identification of tissue transglutaminase as the autoantigen of celiac disease. *Nature Med.* 3: 797–801, 1997. ; and

[34080] Gentile, V.; Saydak, M.; Chiocca, E. A.; Akande, O.; Birckbichler, P. J.; Lee, K. N.; Stein, J. P.; Davies, P. J. A. : Isolation and characterization of cDNA clones to mouse macrophage a.

[34081] Further studies establishing the function and utilities of TGM2 are found in John Hopkins OMIM database record ID 190196, and in cited publications numbered 5736–5740 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM\_004926) is another VGAM899 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:11363, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34082] Another function of VGAM899 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM\_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM\_031949) is another VGAM899 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE,

designated SEQ ID:31532, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34083] Another function of VGAM899 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM\_031949). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. Chromosome 20 Open Reading Frame 28 (C20orf28, Accession NM\_015417) is another VGAM899 host target gene. C20orf28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf28 BINDING SITE, designated SEQ ID:17719, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34084] Another function of VGAM899 is therefore inhibition of Chromosome 20 Open Reading Frame 28 (C20orf28, Accession NM\_015417). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf28.

KIAA1322 (Accession XM\_052626) is another VGAM899 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36022, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34085] Another function of VGAM899 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1372 (Accession XM\_166244) is another VGAM899 host target gene. KIAA1372 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1372 BINDING SITE, designated SEQ ID:44057, to the

nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34086] Another function of VGAM899 is therefore inhibition of KIAA1372 (Accession XM\_166244). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1372. KIAA1453 (Accession NM\_025090) is another VGAM899 host target gene. KIAA1453 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1453 BINDING SITE, designated SEQ ID:24712, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34087] Another function of VGAM899 is therefore inhibition of KIAA1453 (Accession NM\_025090). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1453. MGC4342 (Accession NM\_024329) is another VGAM899 host target gene. MGC4342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC4342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4342 BINDING SITE, designated SEQ ID:23622, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34088] Another function of VGAM899 is therefore inhibition of MGC4342 (Accession NM\_024329). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4342. MICAL (Accession NM\_022765) is another VGAM899 host target gene. MICAL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MICAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MICAL BINDING SITE, designated SEQ ID:23010, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34089] Another function of VGAM899 is therefore inhibition of MICAL (Accession NM\_022765). Accordingly, utilities of

VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MICAL. MSTP032 (Accession NM\_025226) is another VGAM899 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24907, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34090] Another function of VGAM899 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620) is another VGAM899 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35017, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34091] Another function of VGAM899 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM\_047620). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM899 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16082, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34092] Another function of VGAM899 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SDC3. Torsin Family 2, Member A (TOR2A, Accession NM\_130459) is another VGAM899 host target gene. TOR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ ID:28219, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34093] Another function of VGAM899 is therefore inhibition of Torsin Family 2, Member A (TOR2A, Accession NM\_130459). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR2A. LOC125268 (Accession XM\_071960) is another VGAM899 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, desig-

nated SEQ ID:37450, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34094] Another function of VGAM899 is therefore inhibition of LOC125268 (Accession XM\_071960). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268. LOC145757 (Accession XM\_085227) is another VGAM899 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37972, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34095] Another function of VGAM899 is therefore inhibition of LOC145757 (Accession XM\_085227). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC148397 (Accession XM\_086171) is another VGAM899 host target gene. LOC148397 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148397 BINDING SITE, designated SEQ ID:38527, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34096] Another function of VGAM899 is therefore inhibition of LOC148397 (Accession XM\_086171). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148397. LOC148479 (Accession XM\_086204) is another VGAM899 host target gene. LOC148479 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148479 BINDING SITE, designated SEQ ID:38539, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34097] Another function of VGAM899 is therefore inhibition of

LOC148479 (Accession XM\_086204). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148479. LOC151568 (Accession NM\_138483) is another VGAM899 host target gene. LOC151568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151568 BINDING SITE, designated SEQ ID:28835, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34098] Another function of VGAM899 is therefore inhibition of LOC151568 (Accession NM\_138483). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151568. LOC152633 (Accession XM\_098248) is another VGAM899 host target gene. LOC152633 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152633, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152633 BINDING SITE, designated SEQ ID:41532, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34099] Another function of VGAM899 is therefore inhibition of LOC152633 (Accession XM\_098248). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152633. LOC222057 (Accession XM\_166594) is another VGAM899 host target gene. LOC222057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:44572, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34100] Another function of VGAM899 is therefore inhibition of LOC222057 (Accession XM\_166594). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057. LOC51112 (Accession NM\_016030) is an-

other VGAM899 host target gene. LOC51112 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51112 BINDING SITE, designated SEQ ID:18112, to the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, also designated SEQ ID:3610.

[34101] Another function of VGAM899 is therefore inhibition of LOC51112 (Accession NM\_016030). Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51112. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 900 (VGAM900) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34102] VGAM900 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM900 was detected is described

hereinabove with reference to Figs. 1–8.

[34103] VGAM900 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34104] VGAM900 gene encodes a VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM900 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM900 precursor RNA is designated SEQ ID:886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:886 is located at position 111776 relative to the genome of Human Herpesvirus 5.

[34105] VGAM900 precursor RNA folds onto itself, forming VGAM900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34106] An enzyme complex designated DICER COMPLEX, `dices` the VGAM900 folded precursor RNA into VGAM900 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM900 RNA is designated SEQ ID:3611, and is provided hereinbelow with reference to the sequence listing part.

[34107] VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM900 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34108] VGAM900 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM900 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM900 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34109] The complementary binding of VGAM900 RNA, herein designated VGAM RNA, to host target binding sites on VGAM900 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM900 host target RNA into VGAM900 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34110] It is appreciated that VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM900 host target genes. The mRNA of each one of this plurality of VGAM900 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM900 RNA, herein designated VGAM RNA, and which when bound by VGAM900 RNA causes inhibition of translation of respective one or more VGAM900 host target proteins.

[34111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM900 gene, herein designated VGAM GENE, on one or more VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34112] It is yet further appreciated that a function of VGAM900 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM900 correlate with, and may be deduced from, the identity of the host target genes which VGAM900 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34113] Nucleotide sequences of the VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM900 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM900 are further described hereinbelow with reference to Table 1.

[34114] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM900 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM900 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34115] As mentioned hereinabove with reference to Fig. 1, a function of VGAM900 gene, herein designated VGAM is inhibition of expression of VGAM900 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM900 correlate with, and may be deduced from, the identity of the target genes which VGAM900 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34116] Axin 1 (AXIN1, Accession XM\_027520) is a VGAM900 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30511, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34117] A function of VGAM900 is therefore inhibition of Axin 1 (AXIN1, Accession XM\_027520). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. CDP-diacylglycerol Synthase (phosphatidate cytidylyl-transferase) 2 (CDS2, Accession NM\_003818) is another VGAM900 host target gene. CDS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDS2 BINDING SITE, designated SEQ ID:9909, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34118] Another function of VGAM900 is therefore inhibition of CDP-diacylglycerol Synthase (phosphatidate cytidylyl-transferase) 2 (CDS2, Accession NM\_003818), a gene

which is a key regulator of the amount of PIP2 available for signaling. Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDS2. The function of CDS2 has been established by previous studies.

4,5-bisphosphate (PIP2) plays a central role in *Drosophila* phototransduction. A photoreceptor-specific form of the enzyme CDP-diacylglycerol synthase (CDS; EC 2.7.7.41), which catalyzes the formation of CDP-diacylglycerol from phosphatidic acid, is a key regulator of the amount of PIP2 available for signaling. By screening EST databases, Halford et al. (1998) identified a partial human cDNA with sequence similarity to CDS1 (OMIM Ref. No. 603548). The deduced partial polypeptide, which they designated CDS2, is 69% identical to CDS1. Volta et al. (1999) isolated additional cDNAs encoding mouse and human CDS2. The predicted human CDS2 protein contains 445 amino acids with 9 transmembrane domains. The sequences of human CDS2 and *Drosophila* CDS proteins are 65% identical. Northern blot analysis revealed that CDS2 was expressed as greater than 9.5-, 4.4-, and approximately 3-kb mRNAs in all tissues tested. In situ hybridization to adult and embryonic mouse tissue sections showed that *Cds2* is

highly expressed in the differentiating neuroblasts of the neural retina and in the central nervous system during embryonic development, although not in the adult retina.

[34119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34120] Halford, S.; Dulai, K. S.; Daw, S. C.; Fitzgibbon, J.; Hunt, D. M. : Isolation and chromosomal localization of two human CDP-diacylglycerol synthase (CDS) genes. Genomics 54: 140–144, 1998. ; and

[34121] Volta, M.; Bulfone, A.; Gattuso, C.; Rossi, E.; Mariani, M.; Consalez, G. G.; Zuffardi, O.; Ballabio, A.; Banfi, S.; Franco, B. : Identification and characterization of CDS2, a mammalia.

[34122] Further studies establishing the function and utilities of CDS2 are found in John Hopkins OMIM database record ID 603549, and in cited publications numbered 4946–4947 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kinesin Family Member 3C (KIF3C, Accession NM\_002254) is another VGAM900 host target gene. KIF3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF3C, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3C BINDING SITE, designated SEQ ID:8057, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34123] Another function of VGAM900 is therefore inhibition of Kinesin Family Member 3C (KIF3C, Accession NM\_002254). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3C. Lymphoblastic Leukemia Derived Sequence 1 (LYL1, Accession NM\_005583) is another VGAM900 host target gene. LYL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LYL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYL1 BINDING SITE, designated SEQ ID:12109, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34124] Another function of VGAM900 is therefore inhibition of Lymphoblastic Leukemia Derived Sequence 1 (LYL1, Ac-

cession NM\_005583), a gene which has a Putative helix-loop-helix DNA binding factor;. Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYL1. The function of LYL1 has been established by previous studies. suggested that LYAAT1 is a lysosomal transporter that actively exports neutral amino acids from lysosomes by chemiosmotic coupling to the H(+)-ATPase of these organelles.

[34125] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34126] Kuo, S. S.; Mellentin, J. D.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Cleary, M. L. : Structure, chromosome mapping, and expression of the mouse Lyl-1 gene. *Oncogene* 6: 961-968, 1991. ; and

[34127] Trask, B.; Fertitta, A.; Christensen, M.; Youngblom, J.; Bergmann, A.; Copeland, A.; de Jong, P.; Mohrenweiser, H.; Olsen, A.; Carrano, A.; Tynan, K. : Fluorescence in situ hybridization.

[34128] Further studies establishing the function and utilities of LYL1 are found in John Hopkins OMIM database record ID 151440, and in cited publications numbered 3559-356

and 4710 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915) is another VGAM900 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13793, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34129] Another function of VGAM900 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. ATP6V1EL2 (Accession NM\_080653) is another VGAM900 host target gene. ATP6V1EL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP6V1EL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of ATP6V1EL2 BINDING SITE, designated SEQ ID:27940, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34130] Another function of VGAM900 is therefore inhibition of ATP6V1EL2 (Accession NM\_080653). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1EL2. Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603) is another VGAM900 host target gene. C20orf162 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE, designated SEQ ID:27916, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34131] Another function of VGAM900 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM\_080603). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf162. GAPCENA (Accession NM\_012197) is another VGAM900 host target gene. GAPCENA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAPCENA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:14494, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34132] Another function of VGAM900 is therefore inhibition of GAPCENA (Accession NM\_012197). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAPCENA. KIAA1126 (Accession XM\_050325) is another VGAM900 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35609, to the nucleotide sequence of

VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34133] Another function of VGAM900 is therefore inhibition of KIAA1126 (Accession XM\_050325). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. MGC2574 (Accession NM\_024098) is another VGAM900 host target gene. MGC2574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2574 BINDING SITE, designated SEQ ID:23538, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34134] Another function of VGAM900 is therefore inhibition of MGC2574 (Accession NM\_024098). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2574. Ring Finger Protein 24 (RNF24, Accession NM\_007219) is another VGAM900 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14086, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34135] Another function of VGAM900 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM\_007219). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. Rpo1-2 (Accession NM\_032212) is another VGAM900 host target gene. Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by Rpo1-2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE1 and Rpo1-2 BINDING SITE2, designated SEQ ID:25931 and SEQ ID:21096 respectively, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ

ID:3611.

[34136] Another function of VGAM900 is therefore inhibition of Rpo1-2 (Accession NM\_032212). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. LOC221416 (Accession XM\_168094) is another VGAM900 host target gene. LOC221416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221416 BINDING SITE, designated SEQ ID:45025, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34137] Another function of VGAM900 is therefore inhibition of LOC221416 (Accession XM\_168094). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221416. LOC253502 (Accession XM\_170561) is another VGAM900 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253502, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253502 BINDING SITE, designated SEQ ID:45382, to the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, also designated SEQ ID:3611.

[34138] Another function of VGAM900 is therefore inhibition of LOC253502 (Accession XM\_170561). Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 901 (VGAM901) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34139] VGAM901 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM901 was detected is described hereinabove with reference to Figs. 1–8.

[34140] VGAM901 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus Virus SIRV–1.

VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34141] VGAM901 gene encodes a VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM901 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM901 precursor RNA is designated SEQ ID:887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:887 is located at position 8223 relative to the genome of Sulfolobus Virus SIRV-1.

[34142] VGAM901 precursor RNA folds onto itself, forming VGAM901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34143] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM901 folded precursor RNA into VGAM901 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM901 RNA is designated SEQ ID:3612, and is provided hereinbelow with reference to the sequence listing part.

[34144] VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM901 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34145] VGAM901 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM901 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM901 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34146] The complementary binding of VGAM901 RNA, herein designated VGAM RNA, to host target binding sites on VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM901 host target RNA into VGAM901 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34147] It is appreciated that VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM901 host target genes. The mRNA of each one of this plurality of VGAM901 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM901 RNA, herein designated VGAM RNA, and which when bound by VGAM901 RNA causes inhibition of translation of respective one or more VGAM901 host target proteins.

[34148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM901 gene, herein designated VGAM GENE, on one or more VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34149] It is yet further appreciated that a function of VGAM901 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of viral infection by Sulfolobus Virus SIRV-1. Specific functions, and accordingly utilities, of VGAM901 correlate with, and may be deduced from, the identity of the host target genes which VGAM901 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34150] Nucleotide sequences of the VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM901 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM901 are further described hereinbelow with reference to Table 1.

- [34151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM901 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM901 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [34152] As mentioned hereinabove with reference to Fig. 1, a function of VGAM901 gene, herein designated VGAM is inhibition of expression of VGAM901 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM901 correlate with, and may be deduced from, the identity of the target genes which VGAM901 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [34153] Centaurin, Delta 1 (CENTD1, Accession NM\_139182) is a VGAM901 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BIND-

ING SITE2, designated SEQ ID:29200 and SEQ ID:17562 respectively, to the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, also designated SEQ ID:3612.

[34154] A function of VGAM901 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM\_139182), a gene which is involved in cell signaling/communication. Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445.TEM5 (Accession NM\_032777) is another VGAM901 host target gene. TEM5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM5 BINDING SITE, designated SEQ ID:26521, to the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, also designated SEQ ID:3612.

[34155] Another function of VGAM901 is therefore inhibition of

TEM5 (Accession NM\_032777), a gene which involves in development of midline glia and commissural axon pathways. Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM5. The function of TEM5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM406. EFA6R (Accession NM\_015310) is another VGAM901 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17627, to the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, also designated SEQ ID:3612.

[34156] Another function of VGAM901 is therefore inhibition of EFA6R (Accession NM\_015310). Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. FLJ13910 (Accession NM\_022780) is another VGAM901 host target gene. FLJ13910 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23059, to the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, also designated SEQ ID:3612.

[34157] Another function of VGAM901 is therefore inhibition of FLJ13910 (Accession NM\_022780). Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. KIAA1077 (Accession XM\_053496) is another VGAM901 host target gene. KIAA1077 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1077 BINDING SITE, designated SEQ ID:36094, to the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, also designated SEQ ID:3612.

[34158] Another function of VGAM901 is therefore inhibition of

KIAA1077 (Accession XM\_053496). Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1077. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 902 (VGAM902) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34159] VGAM902 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM902 was detected is described hereinabove with reference to Figs. 1–8.

[34160] VGAM902 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus Virus SIRV–1. VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34161] VGAM902 gene encodes a VGAM902 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM902 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM902 precursor RNA is designated SEQ ID:888, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:888 is located at position 8730 relative to the genome of Sulfolobus Virus SIRV-1.

[34162] VGAM902 precursor RNA folds onto itself, forming VGAM902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34163] An enzyme complex designated DICER COMPLEX, `dices` the VGAM902 folded precursor RNA into VGAM902 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM902 RNA is designated SEQ ID:3613, and is provided hereinbelow with reference to the sequence listing part.

[34164] VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM902 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34165] VGAM902 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM902 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM902 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34166] The complementary binding of VGAM902 RNA, herein designated VGAM RNA, to host target binding sites on VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM902 host target RNA into VGAM902 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34167] It is appreciated that VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM902 host target genes. The mRNA of each one of this plurality of VGAM902 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM902 RNA, herein designated VGAM RNA, and which when bound by VGAM902 RNA causes inhibition of translation of respective one or more VGAM902 host target proteins.

[34168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM902 gene, herein designated VGAM GENE, on one or more VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34169] It is yet further appreciated that a function of VGAM902 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of viral infection by Sulfolobus Virus SIRV-1. Specific functions, and accordingly utilities, of VGAM902 correlate with, and may be deduced from, the identity of the host target genes which VGAM902 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34170] Nucleotide sequences of the VGAM902 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM902 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM902 are further described hereinbelow with reference to Table 1.

[34171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM902 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM902 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34172] As mentioned hereinabove with reference to Fig. 1, a function of VGAM902 gene, herein designated VGAM is inhibition of expression of VGAM902 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM902 correlate with, and may be deduced from, the identity of the target genes which VGAM902 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34173] Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is a VGAM902 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12659, to the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, also designated SEQ ID:3613.

[34174] A function of VGAM902 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utili-

ties of VGAM902 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336) is another VGAM902 host target gene. UBE2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2A BINDING SITE, designated SEQ ID:9339, to the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, also designated SEQ ID:3613.

[34175] Another function of VGAM902 is therefore inhibition of Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv-damaged dna. Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with UBE2A. The function of UBE2A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM294. Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM\_033409) is another VGAM902 host target gene. C20orf54 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf54, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf54 BINDING SITE, designated SEQ ID:27226, to the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, also designated SEQ ID:3613.

[34176] Another function of VGAM902 is therefore inhibition of Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM\_033409). Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf54. CAP350 (Accession NM\_014810) is another VGAM902 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:16770, to the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, also designated SEQ ID:3613.

[34177] Another function of VGAM902 is therefore inhibition of CAP350 (Accession NM\_014810). Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. Phytoceramidase, Alkaline (PHCA, Accession NM\_018367) is another VGAM902 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20374, to the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, also designated SEQ ID:3613.

[34178] Another function of VGAM902 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM\_018367).

Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 903 (VGAM903) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34179] VGAM903 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM903 was detected is described hereinabove with reference to Figs. 1–8.

[34180] VGAM903 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34181] VGAM903 gene encodes a VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM903 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM903 precursor RNA is designated SEQ ID:889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:889 is located at position 178832 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[34182] VGAM903 precursor RNA folds onto itself, forming VGAM903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34183] An enzyme complex designated DICER COMPLEX, `dices` the VGAM903 folded precursor RNA into VGAM903 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM903 RNA is designated SEQ ID:3614, and

is provided hereinbelow with reference to the sequence listing part.

[34184] VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM903 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34185] VGAM903 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM903 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM903 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34186] The complementary binding of VGAM903 RNA, herein designated VGAM RNA, to host target binding sites on VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM903 host target RNA into VGAM903 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34187] It is appreciated that VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM903 host target genes. The mRNA of each one of this plurality of VGAM903 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM903 RNA, herein designated VGAM RNA, and which when bound by VGAM903 RNA causes inhibition of translation of respective one or more VGAM903 host target proteins.

[34188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM903 gene, herein designated VGAM GENE, on one or more VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34189] It is yet further appreciated that a function of VGAM903 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM903 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM903 correlate with, and may be deduced from, the identity of the host target genes which VGAM903 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34190] Nucleotide sequences of the VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM903 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM903 are further described hereinbelow with reference to Table 1.

[34191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM903 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM903 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34192] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM903 gene, herein designated VGAM is inhibition of expression of VGAM903 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM903 correlate with, and may be deduced from, the identity of the target genes which VGAM903 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34193] FLJ20707 (Accession NM\_017936) is a VGAM903 host target gene. FLJ20707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20707 BINDING SITE, designated SEQ ID:19628, to the nucleotide sequence of VGAM903 RNA, herein designated VGAM RNA, also designated SEQ ID:3614.

[34194] A function of VGAM903 is therefore inhibition of FLJ20707 (Accession NM\_017936). Accordingly, utilities of VGAM903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20707. FLJ21934 (Accession NM\_024743) is another VGAM903 host target gene. FLJ21934 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ21934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21934 BINDING SITE, designated SEQ ID:24080, to the nucleotide sequence of VGAM903 RNA, herein designated VGAM RNA, also designated SEQ ID:3614.

[34195] Another function of VGAM903 is therefore inhibition of FLJ21934 (Accession NM\_024743). Accordingly, utilities of VGAM903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21934. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 904 (VGAM904) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34196] VGAM904 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM904 was detected is described hereinabove with reference to Figs. 1-8.

[34197] VGAM904 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34198] VGAM904 gene encodes a VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM904 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM904 precursor RNA is designated SEQ ID:890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:890 is located at position 179537 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[34199] VGAM904 precursor RNA folds onto itself, forming VGAM904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM904 folded precursor RNA into VGAM904 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM904 RNA is designated SEQ ID:3615, and is provided hereinbelow with reference to the sequence listing part.

[34201] VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM904 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34202] VGAM904 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM904 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM904 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34203] The complementary binding of VGAM904 RNA, herein designated VGAM RNA, to host target binding sites on VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM904 host tar-

get RNA into VGAM904 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34204] It is appreciated that VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM904 host target genes. The mRNA of each one of this plurality of VGAM904 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM904 RNA, herein designated VGAM RNA, and which when bound by VGAM904 RNA causes inhibition of translation of respective one or more VGAM904 host target proteins.

[34205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM904 gene, herein designated VGAM GENE, on one or more VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34206] It is yet further appreciated that a function of VGAM904 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM904 correlate with, and may be deduced from, the identity of the host target genes which VGAM904 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34207] Nucleotide sequences of the VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM904 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM904 are further

described hereinbelow with reference to Table 1.

[34208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM904 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM904 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM904 gene, herein designated VGAM is inhibition of expression of VGAM904 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM904 correlate with, and may be deduced from, the identity of the target genes which VGAM904 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34210] CARPX (Accession NM\_020178) is a VGAM904 host target gene. CARPX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARPX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARPX BINDING SITE, designated SEQ

ID:21394, to the nucleotide sequence of VGAM904 RNA, herein designated VGAM RNA, also designated SEQ ID:3615.

[34211] A function of VGAM904 is therefore inhibition of CARPX (Accession NM\_020178), a gene which is alpha-carbonic anhydrases-related protein. Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARPX. The function of CARPX has been established by previous studies. Hewett-Emmett and Tashian (1996) described an alignment of 6 human brain ESTs that encode part of an alpha-carbonic anhydrase, which they named CA X. They noted that gln92, his94, and his119, which are invariant in all alpha-CA isozymes with catalytic activity, were replaced by glu, arg, and gln, respectively. They therefore suggested that CA X might represent a new CA-related protein (CA-RP). In reporting the sequence of partial CA XI (OMIM Ref. No. 604644) cDNAs from human and mouse, Lovejoy et al. (1998) stated that these sequences were most homologous to the human CA X sequence. They reported an extended but incomplete human CA X protein sequence of 169 amino acids that was based on exons in a BAC clone containing human genomic DNA from chro-

mosome 17 (GenBank AC002090) and 5 additional human ESTs.

[34212] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34213] Hewett-Emmett, D.; Tashian, R. E. : Functional diversity, conservation, and convergence in the evolution of the alpha-, beta-, and gamma-carbonic anhydrase gene families. *Molec. Phylogenet. Evol.* 5: 50-77, 1996. ; and

[34214] Lovejoy, D. A.; Hewett-Emmett, D.; Porter, C. A.; Cepoi, D.; Sheffield, A.; Vale, W. W.; Tashian, R. E. : Evolutionarily conserved, 'acatalytic' carbonic anhydrase-related protein XI con.

[34215] Further studies establishing the function and utilities of CARPX are found in John Hopkins OMIM database record ID 604642, and in cited publications numbered 6935-6938 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interferon (alpha, beta and omega) Receptor 1 (IFNAR1, Accession NM\_000629) is another VGAM904 host target gene. IFNAR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IFNAR1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR1 BINDING SITE, designated SEQ ID:6245, to the nucleotide sequence of VGAM904 RNA, herein designated VGAM RNA, also designated SEQ ID:3615.

[34216] Another function of VGAM904 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 1 (IFNAR1, Accession NM\_000629), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR1. The function of IFNAR1 has been established by previous studies. Alpha-type antiviral protein is a factor, presumably protein in nature, that mediates specific interferon inhibition of virus replication. According to studies of mouse-man hybrid clones, the locus determining this protein is carried on chromosome 21 (Tan et al., 1973). Tan et al. (1974) made observations of dosage effect in monosomy-21 and trisomy-21 cells which supported assignment of the locus to chromosome 21. This character was also called interferon sensitivity (IS). Chany et al. (1975) showed that trisomy-21 cells have increased interferon sensitivity. Trisomy-16 cells have reduced sensitiv-

ity. This might suggest the presence on chromosome 16 of a regulator of mouse antiviral protein. Revel et al. (1976) showed that antibody to a cell surface component coded by human chromosome 21 inhibited the action of interferon. This suggested that antiviral protein is an interferon receptor. See 147570, 147640, 147660 for a discussion of the gamma, beta, and alpha interferons, respectively. De Clercq et al. (1976) concluded that it is not a cell membrane receptor for interferon that is encoded by chromosome 21. Cellular responses to cytokines involve cross-communication through their respective receptors. The IFNs alpha, beta, and gamma mediate innate immune responses to viral infection through IFNAR1/IFNAR2 (OMIM Ref. No. 602376) for IFNA and IFNB, and IFNGR1 (OMIM Ref. No. 107470)/IFNGR2 (OMIM Ref. No. 147569) for IFNG. Stimulation of these receptors activates Janus protein kinases (e.g., JAK1, 147795 and JAK2, 147796), which leads to the tyrosine phosphorylation of STAT1 (OMIM Ref. No. 600555) and STAT2 (OMIM Ref. No. 600556). Although the IFN receptors are expressed at low levels in cells, they may be clustered in the cell membrane to permit efficient signal transduction. Using mouse embryonic fibroblasts (MEFs) from IFNAR1- and

IFNGR1-deficient mice, Takaoka et al. (2000) observed that the STAT1-mediated DNA-binding activity and the antiviral response to IFNG in IFNAR-null MEFs but not to IFNA in IFNGR-null MEFs are impaired. Restoration of the IFNG response requires constitutive subthreshold IFNA/IFNB signaling and an intact IFNAR1 capable of interacting with STAT1 after tyrosine phosphorylation. Immunoblot analysis showed that IFNAR1 coimmunoprecipitated with the nonligand-binding component, IFNGR2, of the IFNGR complex in wildtype MEFs but less well in IFNB-null MEFs. Immunoblot analysis also demonstrated that the IFN receptor components are exclusively localized in the caveolar membrane fractions (see OMIM Ref. No. CAV1; 601047) where there is a concentration of cytoplasmically oriented signaling molecules

[34217] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34218] Takaoka, A.; Mitani, Y.; Suemori, H.; Sato, M.; Yokochi, T.; Noguchi, S.; Tanaka, N.; Taniguchi, T. : Cross talk between interferon-gamma and -alpha/beta signaling components in caveolar membrane domains. Science 288: 2357-2360, 2000. ; and

[34219] Revel, M.; Bash, D.; Ruddle, F. H. : Antibodies to a cell-surface component coded by human chromosome 21 inhibit action of interferon. Nature 260: 139-141, 1976.

[34220] Further studies establishing the function and utilities of IFNAR1 are found in John Hopkins OMIM database record ID 107450, and in cited publications numbered 12523-11826, 2737, 3910, 11827-1183 and 3643-3651 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0318 (Accession XM\_044334) is another VGAM904 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34183, to the nucleotide sequence of VGAM904 RNA, herein designated VGAM RNA, also designated SEQ ID:3615.

[34221] Another function of VGAM904 is therefore inhibition of KIAA0318 (Accession XM\_044334). Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0318. LOC160414 (Accession XM\_100898) is another VGAM904 host target gene. LOC160414 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160414 BINDING SITE, designated SEQ ID:42102, to the nucleotide sequence of VGAM904 RNA, herein designated VGAM RNA, also designated SEQ ID:3615.

[34222] Another function of VGAM904 is therefore inhibition of LOC160414 (Accession XM\_100898). Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160414. LOC57086 (Accession NM\_020351) is another VGAM904 host target gene. LOC57086 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:21615, to the nucleotide sequence of VGAM904 RNA, herein designated

VGAM RNA, also designated SEQ ID:3615.

[34223] Another function of VGAM904 is therefore inhibition of LOC57086 (Accession NM\_020351). Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 905 (VGAM905) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34224] VGAM905 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM905 was detected is described hereinabove with reference to Figs. 1–8.

[34225] VGAM905 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34226] VGAM905 gene encodes a VGAM905 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM905 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM905 precursor RNA is designated SEQ ID:891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:891 is located at position 79238 relative to the genome of Saimiriine Herpesvirus 2.

[34227] VGAM905 precursor RNA folds onto itself, forming VGAM905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34228] An enzyme complex designated DICER COMPLEX, `dices` the VGAM905 folded precursor RNA into VGAM905 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM905 RNA is designated SEQ ID:3616, and is provided hereinbelow with reference to the sequence listing part.

[34229] VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM905 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34230] VGAM905 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM905 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM905 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34231] The complementary binding of VGAM905 RNA, herein designated VGAM RNA, to host target binding sites on VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM905 host target RNA into VGAM905 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34232] It is appreciated that VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM905 host target genes. The mRNA of

each one of this plurality of VGAM905 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM905 RNA, herein designated VGAM RNA, and which when bound by VGAM905 RNA causes inhibition of translation of respective one or more VGAM905 host target proteins.

[34233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM905 gene, herein designated VGAM GENE, on one or more VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[34234] It is yet further appreciated that a function of VGAM905 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM905 correlate with, and may be deduced from, the identity of the host target genes which VGAM905 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34235] Nucleotide sequences of the VGAM905 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM905 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM905 are further described hereinbelow with reference to Table 1.

[34236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM905 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM905 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[34237] As mentioned hereinabove with reference to Fig. 1, a function of VGAM905 gene, herein designated VGAM is inhibition of expression of VGAM905 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM905 correlate with, and may be deduced from, the identity of the target genes which VGAM905 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34238] ABH (Accession XM\_007409) is a VGAM905 host target gene. ABH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABH BINDING SITE, designated SEQ ID:30056, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34239] A function of VGAM905 is therefore inhibition of ABH (Accession XM\_007409). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABH. Brain

and Acute Leukemia, Cytoplasmic (BAALC, Accession NM\_024812) is another VGAM905 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24195, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34240] Another function of VGAM905 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM\_024812). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. CD34 Antigen (CD34, Accession NM\_001773) is another VGAM905 host target gene. CD34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ

ID:7537, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34241] Another function of VGAM905 is therefore inhibition of CD34 Antigen (CD34, Accession NM\_001773), a gene which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34. The function of CD34 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Deoxycytidine Kinase (DCK, Accession NM\_000788) is another VGAM905 host target gene. DCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCK BINDING SITE, designated SEQ ID:6443, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34242] Another function of VGAM905 is therefore inhibition of

Deoxycytidine Kinase (DCK, Accession NM\_000788), a gene which mediates the phosphorylation of several deoxyribonucleosides and their analogs. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCK. The function of DCK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM\_022977) is another VGAM905 host target gene. FACL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FACL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:23255, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34243] Another function of VGAM905 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM\_022977). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FACL4. FREB (Accession NM\_032738) is another VGAM905 host target gene. FREB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FREB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREB BINDING SITE, designated SEQ ID:26466, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34244] Another function of VGAM905 is therefore inhibition of FREB (Accession NM\_032738). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREB. Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877) is another VGAM905 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6563, to the nucleotide sequence of VGAM905 RNA, herein designated

VGAM RNA, also designated SEQ ID:3616.

[34245] Another function of VGAM905 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM\_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM704. Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801) is another VGAM905 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26555, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34246] Another function of VGAM905 is therefore inhibition of Junctional Adhesion Molecule 3 (JAM3, Accession

NM\_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534) is another VGAM905 host target gene. NCOA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13283, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34247] Another function of VGAM905 is therefore inhibition of Nuclear Receptor Coactivator 3 (NCOA3, Accession NM\_006534), a gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of

VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699) is another VGAM905 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:30122, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34248] Another function of VGAM905 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1. The function of NRIP1 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Prominin-like 1 (mouse) (PROML1, Accession NM\_006017) is another VGAM905 host target gene.

PROML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROML1 BINDING SITE, designated SEQ ID:12634, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34249] Another function of VGAM905 is therefore inhibition of Prominin-like 1 (mouse) (PROML1, Accession NM\_006017), a gene which is a Transmembrane protein. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROML1. The function of PROML1 has been established by previous studies. the prominin 5-transmembrane domain glycoprotein was originally identified as a protein that selectively localized at the apical surface of murine neuroepithelial cells, whereas

PROML1 was identified as an antigenic marker (AC133 antigen) in hematopoietic stem cells (Miraglia et al., 1997; Yin et al., 1997) and found to be expressed in retinoblastoma cell lines and adult retina. Most of the PROML1 gene is contained in 23 exons distributed over more than 50 kb of genomic sequence. The gene is predicted to encode an 865-amino acid glycoprotein. Prominin is conserved throughout the animal kingdom. Photoreceptors are the cells in the retina that are responsible for generation of the neuronal signal in response to light. The outer segments of vertebrate photoreceptors house a stack of photoreceptive membranes called disks. These membranes have a high rate of turnover. Disks of vertebrate photoreceptors are produced at the base of the outer segments initially by evagination of the plasma membrane with subsequent rim formation and membrane fusion resulting in release of the individual disks into the cytoplasm. The disks are ultimately shed from the terminal end of the outer segment and phagocytosed by the retinal pigment epithelium. A similar, although not identical process appears to occur in cone photoreceptor disks. Because of their origin from the plasma membranes, genes that encode retinal proteins targeted to plasma membrane pro-

trusions represent candidates for inherited retinal degenerations. One such candidate is the gene encoding human PROML1. Murine prominin (prom) shows a strong preference for plasma membrane protrusions in a variety of epithelial cells, whereas PROML1 is expressed in retinoblastoma cell lines and adult retina. Maw et al. (2000) performed molecular genetic analyses on an Indian pedigree segregating for autosomal recessive retinal degeneration and found that affected individuals were homozygous for deletion of nucleotide 1878 (a G) in PROML1 (604365.0001). This alteration was predicted to result in a frameshift at codon 614 with premature termination of translation. Expression of a similar prom deletion mutant in CHO cells indicated that the truncated protein does not reach the cell surface. Immunocytochemistry indicated that prom is concentrated in the plasma membrane evaginations at the base of the outer segments of rod photoreceptors. These findings suggested that loss of prominin causes retinal degeneration, possibly because of impaired generation of the evaginations and/or impaired conversion of the evaginations to disks. In the family in which Maw et al. (2000) found the deletion mutation in PROML1, 4 of 8 children were affected, the offspring of an uncle-

niece marriage. Linkage studies localized the mutant gene to 4p. Two-point linkage analysis using the deletion mutation gave a peak lod score of 3.17 at  $\theta = 0.00$ .

Markers distal to D4S1602 formed a haplotype that cosegregated with the disorder. Crossovers indicated that the critical region was proximal to D4S2960 and distal to D4S1567. This region was found to be distinct from the distal PDEB (OMIM Ref. No. 180072) region at 4p16.3 and the proximal CNGA1 (OMIM Ref. No. 123825) region at 4p12-cen; both of these genes had previously been implicated in autosomal recessive retinal degeneration.

[34250] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34251] Maw, M. A.; Corbeil, D.; Koch, J.; Hellwig, A.; Wilson-Wheeler, J. C.; Bridges, R. J.; Kumaramanickavel, G.; John, S.; Nancarrow, D.; Roper, K.; Weigmann, A.; Huttner, W. B.; Denton, M. J. : A frameshift mutation in prominin (mouse)-like 1 causes human retinal degeneration. *Hum. Molec. Genet.* 9: 27-34, 2000. ; and

[34252] Miraglia, S.; Godfrey, W.; Yin, A. H.; Atkins, K.; Warnke, R.; Holden, J. T.; Bray, R. A.; Waller, E. K.; Buck, D. W. : A novel five-transmembrane hematopoietic stem cell anti-

gen: isola.

[34253] Further studies establishing the function and utilities of PROML1 are found in John Hopkins OMIM database record ID 604365, and in cited publications numbered 5316–5318 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RGL (Accession NM\_015149) is another VGAM905 host target gene. RGL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGL BINDING SITE, designated SEQ ID:17505, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34254] Another function of VGAM905 is therefore inhibition of RGL (Accession NM\_015149), a gene which is involved in nucleotide exchange factor. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL. The function of RGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM861.Angiomotin (AMOT, Accession NM\_133265) is another VGAM905 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28420, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34255] Another function of VGAM905 is therefore inhibition of Angiomotin (AMOT, Accession NM\_133265). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. ARSDR1 (Accession NM\_016026) is another VGAM905 host target gene. ARSDR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARSDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARSDR1 BINDING SITE, designated SEQ ID:18111, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA,

also designated SEQ ID:3616.

[34256] Another function of VGAM905 is therefore inhibition of ARSDR1 (Accession NM\_016026). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSDR1. FLJ12171 (Accession NM\_024619) is another VGAM905 host target gene. FLJ12171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12171 BINDING SITE, designated SEQ ID:23880, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34257] Another function of VGAM905 is therefore inhibition of FLJ12171 (Accession NM\_024619). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12171. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM\_043613) is another VGAM905 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRID1, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33977, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34258] Another function of VGAM905 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM\_043613). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. KIAA0332 (Accession XM\_031553) is another VGAM905 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31417, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34259] Another function of VGAM905 is therefore inhibition of KIAA0332 (Accession XM\_031553). Accordingly, utilities

of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA0556 (Accession XM\_044632) is another VGAM905 host target gene. KIAA0556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0556 BINDING SITE, designated SEQ ID:34248, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34260] Another function of VGAM905 is therefore inhibition of KIAA0556 (Accession XM\_044632). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0556. KIAA0826 (Accession XM\_093839) is another VGAM905 host target gene. KIAA0826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0826 BINDING SITE, designated SEQ ID:40214, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34261] Another function of VGAM905 is therefore inhibition of KIAA0826 (Accession XM\_093839). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0826. KIAA0977 (Accession NM\_014900) is another VGAM905 host target gene. KIAA0977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0977 BINDING SITE, designated SEQ ID:17080, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34262] Another function of VGAM905 is therefore inhibition of KIAA0977 (Accession NM\_014900). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0977. KIAA1041 (Accession NM\_014947) is another VGAM905 host target gene. KIAA1041 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17265, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34263] Another function of VGAM905 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1238 (Accession XM\_048675) is another VGAM905 host target gene. KIAA1238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35215, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34264] Another function of VGAM905 is therefore inhibition of

KIAA1238 (Accession XM\_048675). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. Methionyl Aminopeptidase 1 (METAP1, Accession XM\_052334) is another VGAM905 host target gene. METAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by METAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of METAP1 BINDING SITE, designated SEQ ID:35958, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34265] Another function of VGAM905 is therefore inhibition of Methionyl Aminopeptidase 1 (METAP1, Accession XM\_052334). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with METAP1. NIN283 (Accession NM\_032268) is another VGAM905 host target gene. NIN283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIN283, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIN283 BINDING SITE, designated SEQ ID:26015, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34266] Another function of VGAM905 is therefore inhibition of NIN283 (Accession NM\_032268). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIN283. PRO1331 (Accession NM\_030778) is another VGAM905 host target gene. PRO1331 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1331 BINDING SITE, designated SEQ ID:25067, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34267] Another function of VGAM905 is therefore inhibition of PRO1331 (Accession NM\_030778). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO1331. Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM\_013233) is another VGAM905 host target gene. STK39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK39 BINDING SITE, designated SEQ ID:14891, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34268] Another function of VGAM905 is therefore inhibition of Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM\_013233). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK39. TRIP-Br2 (Accession NM\_014755) is another VGAM905 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16493, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34269] Another function of VGAM905 is therefore inhibition of TRIP-Br2 (Accession NM\_014755). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC120856 (Accession XM\_058509) is another VGAM905 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36633, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34270] Another function of VGAM905 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC120939 (Accession XM\_073688) is an-

other VGAM905 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37510, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34271] Another function of VGAM905 is therefore inhibition of LOC120939 (Accession XM\_073688). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC130612 (Accession XM\_059461) is another VGAM905 host target gene. LOC130612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:36997, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34272] Another function of VGAM905 is therefore inhibition of LOC130612 (Accession XM\_059461). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612. LOC148936 (Accession XM\_097556) is another VGAM905 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40931, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34273] Another function of VGAM905 is therefore inhibition of LOC148936 (Accession XM\_097556). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM\_097555) is another VGAM905 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40924, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34274] Another function of VGAM905 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC221504 (Accession XM\_166476) is another VGAM905 host target gene. LOC221504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221504 BINDING SITE, designated SEQ ID:44396, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34275] Another function of VGAM905 is therefore inhibition of LOC221504 (Accession XM\_166476). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221504. LOC91151 (Accession NM\_033208) is another VGAM905 host target gene. LOC91151 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91151 BINDING SITE, designated SEQ ID:27056, to the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, also designated SEQ ID:3616.

[34276] Another function of VGAM905 is therefore inhibition of LOC91151 (Accession NM\_033208). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91151. LOC92391 (Accession XM\_044793) is another VGAM905 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:34273, to the nucleotide sequence of VGAM905 RNA, herein designated

VGAM RNA, also designated SEQ ID:3616.

[34277] Another function of VGAM905 is therefore inhibition of LOC92391 (Accession XM\_044793). Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 906 (VGAM906) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34278] VGAM906 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM906 was detected is described hereinabove with reference to Figs. 1–8.

[34279] VGAM906 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34280] VGAM906 gene encodes a VGAM906 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM906 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM906 precursor RNA is designated SEQ ID:892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:892 is located at position 77662 relative to the genome of Saimiriine Herpesvirus 2.

[34281] VGAM906 precursor RNA folds onto itself, forming VGAM906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34282] An enzyme complex designated DICER COMPLEX, `dices` the VGAM906 folded precursor RNA into VGAM906 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM906 RNA is designated SEQ ID:3617, and is provided hereinbelow with reference to the sequence listing part.

[34283] VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM906 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[34284] VGAM906 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM906 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM906 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34285] The complementary binding of VGAM906 RNA, herein designated VGAM RNA, to host target binding sites on VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM906 host target RNA into VGAM906 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34286] It is appreciated that VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM906 host target genes. The mRNA of

each one of this plurality of VGAM906 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM906 RNA, herein designated VGAM RNA, and which when bound by VGAM906 RNA causes inhibition of translation of respective one or more VGAM906 host target proteins.

[34287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM906 gene, herein designated VGAM GENE, on one or more VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[34288] It is yet further appreciated that a function of VGAM906 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM906 correlate with, and may be deduced from, the identity of the host target genes which VGAM906 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34289] Nucleotide sequences of the VGAM906 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM906 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM906 are further described hereinbelow with reference to Table 1.

[34290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM906 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM906 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[34291] As mentioned hereinabove with reference to Fig. 1, a function of VGAM906 gene, herein designated VGAM is inhibition of expression of VGAM906 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM906 correlate with, and may be deduced from, the identity of the target genes which VGAM906 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34292] UDP-glucose Dehydrogenase (UGDH, Accession NM\_003359) is a VGAM906 host target gene. UGDH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGDH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGDH BINDING SITE, designated SEQ ID:9387, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34293] A function of VGAM906 is therefore inhibition of UDP-glucose Dehydrogenase (UGDH, Accession NM\_003359), a gene which is an UDP-glucose dehydrogenase. Accord-

ingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGDH. The function of UGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736) is another VGAM906 host target gene. XPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPR1 BINDING SITE, designated SEQ ID:11122, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34294] Another function of VGAM906 is therefore inhibition of Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736), a gene which is a putative G protein-coupled receptor and a target for xenotropic and polytropic murine leukemia retroviruses. Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with XPR1. The function of XPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_007247) is another VGAM906 host target gene. AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP1GBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3, designated SEQ ID:14115, SEQ ID:27877 and SEQ ID:27870 respectively, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34295] Another function of VGAM906 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_007247). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. FLJ12598 (Accession NM\_024754) is another VGAM906 host target gene. FLJ12598 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by FLJ12598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12598 BINDING SITE, designated SEQ ID:24097, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34296] Another function of VGAM906 is therefore inhibition of FLJ12598 (Accession NM\_024754). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12598. FLJ21140 (Accession NM\_024776) is another VGAM906 host target gene. FLJ21140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21140 BINDING SITE, designated SEQ ID:24141, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34297] Another function of VGAM906 is therefore inhibition of

FLJ21140 (Accession NM\_024776). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21140. High-mobility Group (nonhistone chromosomal) Protein 17-like 1 (HMG17L1, Accession NM\_021024) is another VGAM906 host target gene. HMG17L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMG17L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG17L1 BINDING SITE, designated SEQ ID:22014, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34298] Another function of VGAM906 is therefore inhibition of High-mobility Group (nonhistone chromosomal) Protein 17-like 1 (HMG17L1, Accession NM\_021024). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG17L1. Myoneurin (MYNN, Accession NM\_018657) is another VGAM906 host target gene. MYNN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYNN, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYNN BINDING SITE, designated SEQ ID:20725, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34299] Another function of VGAM906 is therefore inhibition of Myoneurin (MYNN, Accession NM\_018657). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYNN. Nucleosome Assembly Protein 1-like 1 (NAP1L1, Accession NM\_139207) is another VGAM906 host target gene. NAP1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:29224, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34300] Another function of VGAM906 is therefore inhibition of Nucleosome Assembly Protein 1-like 1 (NAP1L1, Acces-

sion NM\_139207). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1. LOC146050 (Accession XM\_085301) is another VGAM906 host target gene. LOC146050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146050 BINDING SITE, designated SEQ ID:38055, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34301] Another function of VGAM906 is therefore inhibition of LOC146050 (Accession XM\_085301). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146050. LOC158549 (Accession XM\_098963) is another VGAM906 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42009, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34302] Another function of VGAM906 is therefore inhibition of LOC158549 (Accession XM\_098963). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC169166 (Accession XM\_095541) is another VGAM906 host target gene. LOC169166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169166 BINDING SITE, designated SEQ ID:40271, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34303] Another function of VGAM906 is therefore inhibition of LOC169166 (Accession XM\_095541). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169166. LOC199957 (Accession XM\_114068) is an-

other VGAM906 host target gene. LOC199957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199957 BINDING SITE, designated SEQ ID:42671, to the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, also designated SEQ ID:3617.

[34304] Another function of VGAM906 is therefore inhibition of LOC199957 (Accession XM\_114068). Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 907 (VGAM907) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34305] VGAM907 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM907 was detected is described

hereinabove with reference to Figs. 1–8.

[34306] VGAM907 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34307] VGAM907 gene encodes a VGAM907 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM907 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM907 precursor RNA is designated SEQ ID:893, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:893 is located at position 79366 relative to the genome of Saimiriine Herpesvirus 2.

[34308] VGAM907 precursor RNA folds onto itself, forming VGAM907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34309] An enzyme complex designated DICER COMPLEX, `dices` the VGAM907 folded precursor RNA into VGAM907 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM907 RNA is designated SEQ ID:3618, and is provided hereinbelow with reference to the sequence listing part.

[34310] VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM907 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34311] VGAM907 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM907 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM907 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34312] The complementary binding of VGAM907 RNA, herein designated VGAM RNA, to host target binding sites on VGAM907 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM907 host target RNA into VGAM907 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34313] It is appreciated that VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM907 host target genes. The mRNA of each one of this plurality of VGAM907 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM907 RNA, herein designated VGAM RNA, and which when bound by VGAM907 RNA causes inhibition of translation of respective one or more VGAM907 host target proteins.

[34314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM907 gene, herein designated VGAM GENE, on one or more VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34315] It is yet further appreciated that a function of VGAM907 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM907 correlate with, and may be deduced from, the identity of the host target genes which VGAM907 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34316] Nucleotide sequences of the VGAM907 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM907 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM907 are further described hereinbelow with reference to Table 1.

[34317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM907 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM907 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34318] As mentioned hereinabove with reference to Fig. 1, a function of VGAM907 gene, herein designated VGAM is inhibition of expression of VGAM907 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM907 correlate with, and may be deduced from, the identity of the target genes which VGAM907 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34319] HCA4 (Accession XM\_085287) is a VGAM907 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38022, to the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34320] A function of VGAM907 is therefore inhibition of HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA1600 (Accession XM\_049351) is another VGAM907 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35391, to the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34321] Another function of VGAM907 is therefore inhibition of KIAA1600 (Accession XM\_049351). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. Purinergic Receptor P2X-like 1, Orphan Recep-

tor (P2RXL1, Accession NM\_005446) is another VGAM907 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11933, to the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34322] Another function of VGAM907 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1.

LOC133418 (Accession XM\_059649) is another VGAM907 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37038, to the nucleotide se-

quence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34323] Another function of VGAM907 is therefore inhibition of LOC133418 (Accession XM\_059649). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC153222 (Accession XM\_087631) is another VGAM907 host target gene. LOC153222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153222 BINDING SITE, designated SEQ ID:39369, to the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34324] Another function of VGAM907 is therefore inhibition of LOC153222 (Accession XM\_087631). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153222. LOC255098 (Accession XM\_170912) is another VGAM907 host target gene. LOC255098 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC255098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255098 BINDING SITE, designated SEQ ID:45687, to the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, also designated SEQ ID:3618.

[34325] Another function of VGAM907 is therefore inhibition of LOC255098 (Accession XM\_170912). Accordingly, utilities of VGAM907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255098. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 908 (VGAM908) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34326] VGAM908 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM908 was detected is described hereinabove with reference to Figs. 1–8.

[34327] VGAM908 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Saimiriine Herpesvirus 2. VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34328] VGAM908 gene encodes a VGAM908 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM908 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM908 precursor RNA is designated SEQ ID:894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:894 is located at position 78640 relative to the genome of Saimiriine Herpesvirus 2.

[34329] VGAM908 precursor RNA folds onto itself, forming VGAM908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34330] An enzyme complex designated DICER COMPLEX, `dices` the VGAM908 folded precursor RNA into VGAM908 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM908 RNA is designated SEQ ID:3619, and is provided hereinbelow with reference to the sequence listing part.

[34331] VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM908 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34332] VGAM908 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM908 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM908 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34333] The complementary binding of VGAM908 RNA, herein designated VGAM RNA, to host target binding sites on VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM908 host tar-

get RNA into VGAM908 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34334] It is appreciated that VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM908 host target genes. The mRNA of each one of this plurality of VGAM908 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM908 RNA, herein designated VGAM RNA, and which when bound by VGAM908 RNA causes inhibition of translation of respective one or more VGAM908 host target proteins.

[34335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM908 gene, herein designated VGAM GENE, on one or more VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34336] It is yet further appreciated that a function of VGAM908 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM908 correlate with, and may be deduced from, the identity of the host target genes which VGAM908 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34337] Nucleotide sequences of the VGAM908 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM908 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM908 are further

described hereinbelow with reference to Table 1.

[34338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM908 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM908 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34339] As mentioned hereinabove with reference to Fig. 1, a function of VGAM908 gene, herein designated VGAM is inhibition of expression of VGAM908 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM908 correlate with, and may be deduced from, the identity of the target genes which VGAM908 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34340] Eyes Absent Homolog 1 (Drosophila) (EYA1, Accession NM\_000503) is a VGAM908 host target gene. EYA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EYA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EYA1

BINDING SITE, designated SEQ ID:6115, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34341] A function of VGAM908 is therefore inhibition of Eyes Absent Homolog 1 (Drosophila) (EYA1, Accession NM\_000503). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1. Gamma-glutamyltransferase 1 (GGT1, Accession NM\_013421) is another VGAM908 host target gene. GGT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GGT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT1 BINDING SITE, designated SEQ ID:15081, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34342] Another function of VGAM908 is therefore inhibition of Gamma-glutamyltransferase 1 (GGT1, Accession NM\_013421), a gene which catalyzes the transfer of the glutamyl moiety of glutathione to a variety of amino acids and dipeptide acceptors. Accordingly, utilities of

VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT1.

The function of GGT1 has been established by previous studies. Gamma-glutamyltranspeptidase (EC 2.3.2.2) acts as a glutathionase and catalyzes the transfer of the glutamyl moiety of glutathione to a variety of amino acids and dipeptide acceptors. This enzyme is located on the outer surface of the cell membrane. It is widely distributed in mammalian tissues involved in absorption and secretion. In humans, hepatic GGT activity is elevated in some liver diseases. GGT is released into the bloodstream after liver damage, and an elevated level of the enzyme may be a useful early sign of hepatocellular carcinoma. Schulman et al. (1975) described a mildly retarded adult male with glutathionemia and marked glutathionuria, whose cultured skin fibroblasts showed very low activity of the transpeptidase. Since several studies have suggested that the transpeptidase may play a role in cellular amino acid transport, the lack of aminoaciduria and aminoacidemia was noteworthy. O'Daley (1968) may have described the same condition. Hammond et al. (1995) reported sisters with GGT deficiency. The elder of the 2 sibs was detected during the course of a population screening on infants at

6 weeks of age using ascending paper chromatography of urine, which revealed a migration spot similar to that of cystine. Her growth and development were normal. During the second year, easy bruising was noted. Asthma was diagnosed at 2.5 years but was never a major problem. At 10 years of age, she began having attacks of absence and an EEG showed typical 3-Hz spike and wave activity.

Seizures were controlled by valproate medication. At age 21 years, she had no significant health problems, had a good secretarial position, and was pursuing a course at technical college. The younger sister was somewhat hypotonic and inactive at birth and had a dislocated hip and mild bilateral equinovarus. Tube feeding was required for the first 4 months. Problems noted later included strabismus, easy bruising, poor coordination, and some dysmorphic features. A diagnosis of Prader-Willi syndrome (PWS; 176270) was confirmed by demonstration of an interstitial deletion of 15q11-q13. Both sisters had normal red cell glutathione and no Heinz bodies. Clearly there were no specific clinical indicators for GGT deficiency, which in the younger sister was unrelated to PWS. Laperche et al.

(1986) cloned the structural gene for GGT from a rat kidney cDNA library. Taking advantage of its cross-

hybridization with the human genome, Bulle et al. (1987) mapped the GGT gene by in situ hybridization to 22q11.1–q11.2. A minor peak was found in 22q13.1. Rouleau et al. (1988) demonstrated a PvuII polymorphism at the GGT locus and added family linkage analysis to the methods by which GGT has been assigned to chromosome 22. From studies involving restriction analysis, Heisterkamp and Groffen (1988) presented evidence that the transcribed GGT gene lies 3–prime and just distal to the BCR locus (OMIM Ref. No. 151410). Rajpert–De Meyts et al. (1988) isolated cDNAs for GGT. Sakamuro et al. (1988) reported the primary structure of human GGT based on studies of a cDNA. The enzyme consists of 2 peptide chains, heavy and light, composed of 351 and 189 amino acids, respectively. Both are coded by a single gene; the 2 subunits of the mature enzyme are the products of processing of the single precursor peptide. The active site of GGT is located in the light subunit of the mature enzyme. A family of at least 4 GGT genes exists on chromosome 22 (Pawlak et al., 1988; Rajpert–De Meyts et al., 1988). At least 2 of these genes appear to be transcribed, since a human kidney cDNA has been isolated that differs from the placental and liver cDNAs (Pawlak et al., 1989).

[34343] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34344] Hammond, J. W.; Potter, M.; Wilcken, B.; Truscott, R. : Siblings with gamma-glutamyltransferase deficiency. J. Inherit. Metab. Dis. 18: 82–83, 1995. ; and

[34345] Rajpert-De Meyts, E.; Heisterkamp, N.; Groffen, J. : Cloning and nucleotide sequence of human gamma-glutamyl transpeptidase. Proc. Nat. Acad. Sci. 85: 8840–8844, 1988.

[34346] Further studies establishing the function and utilities of GGT1 are found in John Hopkins OMIM database record ID 231950, and in cited publications numbered 5775, 6382–6386, 3354–335 and 6387–6389 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gamma-glutamyltransferase 2 (GGT2, Accession XM\_057166) is another VGAM908 host target gene. GGT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT2 BINDING SITE, designated SEQ

ID:36487, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34347] Another function of VGAM908 is therefore inhibition of Gamma-glutamyltransferase 2 (GGT2, Accession XM\_057166). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT2. MHC Class II Transactivator (MHC2TA, Accession NM\_000246) is another VGAM908 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5777, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34348] Another function of VGAM908 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM\_000246). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Sialidase 3

(membrane sialidase) (NEU3, Accession NM\_006656) is another VGAM908 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:13454, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34349] Another function of VGAM908 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Asporin (LRR class 1) (ASPN, Accession NM\_017680) is another VGAM908 host target gene. ASPN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPN BINDING SITE, designated SEQ ID:19223, to the nucleotide sequence of VGAM908 RNA,

herein designated VGAM RNA, also designated SEQ ID:3619.

[34350] Another function of VGAM908 is therefore inhibition of Asporin (LRR class 1) (ASPN, Accession NM\_017680). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPN. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM\_086728) is another VGAM908 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38834, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34351] Another function of VGAM908 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM\_086728). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. DK-FZP566K023 (Accession NM\_015485) is another VGAM908

host target gene. DKFZP566K023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K023 BINDING SITE, designated SEQ ID:17756, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34352] Another function of VGAM908 is therefore inhibition of DKFZP566K023 (Accession NM\_015485). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K023. F-box Only Protein 24 (FBXO24, Accession NM\_012172) is another VGAM908 host target gene. FBXO24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO24 BINDING SITE, designated SEQ ID:14463, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ

ID:3619.

[34353] Another function of VGAM908 is therefore inhibition of F-box Only Protein 24 (FBXO24, Accession NM\_012172). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO24. FLJ10956 (Accession NM\_018283) is another VGAM908 host target gene. FLJ10956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:20275, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34354] Another function of VGAM908 is therefore inhibition of FLJ10956 (Accession NM\_018283). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. FLJ20281 (Accession XM\_165663) is another VGAM908 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43724, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34355] Another function of VGAM908 is therefore inhibition of FLJ20281 (Accession XM\_165663). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. Integrin, Alpha 10 (ITGA10, Accession XM\_002097) is another VGAM908 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29859, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34356] Another function of VGAM908 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM\_002097). Accordingly, utilities of VGAM908 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ITGA10. KIAA0601 (Accession XM\_031267) is another VGAM908 host target gene. KIAA0601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0601 BINDING SITE, designated SEQ ID:31328, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34357] Another function of VGAM908 is therefore inhibition of KIAA0601 (Accession XM\_031267). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0601. KIAA0700 (Accession XM\_050561) is another VGAM908 host target gene. KIAA0700 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0700 BINDING SITE, designated SEQ ID:35657, to the

nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34358] Another function of VGAM908 is therefore inhibition of KIAA0700 (Accession XM\_050561). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0700. KIAA1373 (Accession XM\_048195) is another VGAM908 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35124, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34359] Another function of VGAM908 is therefore inhibition of KIAA1373 (Accession XM\_048195). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. KIAA1981 (Accession XM\_114000) is another VGAM908 host target gene. KIAA1981 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE, designated SEQ ID:42607, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34360] Another function of VGAM908 is therefore inhibition of KIAA1981 (Accession XM\_114000). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1981. RNAC (Accession NM\_005772) is another VGAM908 host target gene. RNAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAC BINDING SITE, designated SEQ ID:12344, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34361] Another function of VGAM908 is therefore inhibition of RNAC (Accession NM\_005772). Accordingly, utilities of

VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAC.

LOC129676 (Accession XM\_065341) is another VGAM908 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37281, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34362] Another function of VGAM908 is therefore inhibition of LOC129676 (Accession XM\_065341). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC145678 (Accession XM\_096832) is another VGAM908 host target gene. LOC145678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145678 BINDING SITE, designated SEQ ID:40554, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34363] Another function of VGAM908 is therefore inhibition of LOC145678 (Accession XM\_096832). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678. LOC152762 (Accession XM\_087518) is another VGAM908 host target gene. LOC152762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152762 BINDING SITE, designated SEQ ID:39304, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34364] Another function of VGAM908 is therefore inhibition of LOC152762 (Accession XM\_087518). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152762. LOC199957 (Accession XM\_114068) is another VGAM908 host target gene. LOC199957 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199957 BINDING SITE, designated SEQ ID:42673, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34365] Another function of VGAM908 is therefore inhibition of LOC199957 (Accession XM\_114068). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. LOC253024 (Accession XM\_174858) is another VGAM908 host target gene. LOC253024 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253024 BINDING SITE, designated SEQ ID:46604, to the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, also designated SEQ ID:3619.

[34366] Another function of VGAM908 is therefore inhibition of

LOC253024 (Accession XM\_174858). Accordingly, utilities of VGAM908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253024. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 909 (VGAM909) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34367] VGAM909 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM909 was detected is described hereinabove with reference to Figs. 1–8.

[34368] VGAM909 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34369] VGAM909 gene encodes a VGAM909 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM909 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM909 precursor RNA is designated SEQ ID:895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:895 is located at position 60240 relative to the genome of Alcelaphine Herpesvirus 1.

[34370] VGAM909 precursor RNA folds onto itself, forming VGAM909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34371] An enzyme complex designated DICER COMPLEX, `dices` the VGAM909 folded precursor RNA into VGAM909 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM909 RNA is designated SEQ ID:3620, and is provided hereinbelow with reference to the sequence listing part.

[34372] VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM909 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34373] VGAM909 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM909 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM909 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34374] The complementary binding of VGAM909 RNA, herein designated VGAM RNA, to host target binding sites on VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM909 host target RNA into VGAM909 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34375] It is appreciated that VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM909 host target genes. The mRNA of each one of this plurality of VGAM909 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM909 RNA, herein designated VGAM RNA, and which when bound by VGAM909 RNA causes inhibition of translation of respective one or more VGAM909 host target proteins.

[34376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM909 gene, herein designated VGAM GENE, on one or more VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34377] It is yet further appreciated that a function of VGAM909 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM909 correlate with, and may be deduced from, the identity of the host target genes which VGAM909 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34378] Nucleotide sequences of the VGAM909 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM909 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM909 are further described hereinbelow with reference to Table 1.

[34379] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM909 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM909 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34380] As mentioned hereinabove with reference to Fig. 1, a function of VGAM909 gene, herein designated VGAM is inhibition of expression of VGAM909 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM909 correlate with, and may be deduced from, the identity of the target genes which VGAM909 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34381] DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366) is a VGAM909 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42245, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34382] A function of VGAM909 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366), a gene which induces DNA fragmentation and chromatin

condensation during apoptosis. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Desmocollin 2 (DSC2, Accession NM\_004949) is another VGAM909 host target gene. DSC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC2 BINDING SITE, designated SEQ ID:11392, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34383] Another function of VGAM909 is therefore inhibition of Desmocollin 2 (DSC2, Accession NM\_004949), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC2. The function of DSC2 has been established by previous studies. Arnemann et al.

(1991) assigned the single gene responsible for DG II/III to the short arm of chromosome 9 by the study of somatic cell hybrids; however, King et al. (1993) cited unpublished data indicating that DSC3 is in fact not on 9p but rather on chromosome 18 where type 1 desmocollin (DSC1; 125643) is located. Tight linkage between the mouse homologs of NCAD (OMIM Ref. No. 114020), DSG1 (OMIM Ref. No. 125670), TTR (OMIM Ref. No. 176300), and DSC3, all of which are located in a region of mouse chromosome 18 with homology to human 18q, suggested that DSC3 was probably located on 18q12.1. Buxton et al. (1994) found that the human DSC3 gene maps to chromosome 18 by PCR amplification of DNA from a panel of rodent/human somatic cell hybrids. Greenwood et al. (1997) found that the human DSC2 gene, which codes for the most widely distributed form of desmocollins, contains 17 exons ranging in size from 46 to 258 bp and spans more than 32 kb of DNA. Exon 16 is alternatively spliced, giving rise to the a and b forms of the protein. A remarkable degree of conservation of intron position with other cadherins was observed.

[34384] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [34385] Arnemann, J.; Spurr, N. K.; Wheeler, G. N.; Parker, A. E.; Buxton, R. S. : Chromosomal assignment of the human genes coding for the major proteins of the desmosome junction, desmoglein DGI (DSG), desmocollins DGII/III (DSC), desmoplakins DPI/II (DSP), and plakoglobin DPIII (JUP). *Genomics* 10: 640–645, 1991. ; and
- [34386] Greenwood, M. D.; Marsden, M. D.; Cowley, C. M. E.; Sahota, V. K.; Buxton, R. S. : Exon–intron organization of the human type 2 desmocollin gene (DSC2): desmocollin gene structure is cl.
- [34387] Further studies establishing the function and utilities of DSC2 are found in John Hopkins OMIM database record ID 125645, and in cited publications numbered 361–36 and 359 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EphB2 (EPHB2, Accession NM\_004442) is another VGAM909 host target gene. EPHB2 BINDING SITE1 and EPHB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EPHB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE1

and EPHB2 BINDING SITE2, designated SEQ ID:10735 and SEQ ID:18910 respectively, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34388] Another function of VGAM909 is therefore inhibition of EphB2 (EPHB2, Accession NM\_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533.JJAZ1 (Accession NM\_015355) is another VGAM909 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:17657, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34389] Another function of VGAM909 is therefore inhibition of JJAZ1 (Accession NM\_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM231. Mitogen-activated Protein Kinase Kinase 1 (MAP2K1, Accession NM\_002755) is another VGAM909 host target gene. MAP2K1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K1 BINDING SITE, designated SEQ ID:8634, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34390] Another function of VGAM909 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 1 (MAP2K1, Accession NM\_002755), a gene which is a signaling intermediate, may take part in cell transformation. Accordingly,

utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K1. The function of MAP2K1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM528. N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM\_046652) is another VGAM909 host target gene. NAPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPB BINDING SITE, designated SEQ ID:34767, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34391] Another function of VGAM909 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM\_046652). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPB. Retinoblastoma Binding Protein 9 (RBBP9, Accession XM\_046553) is another VGAM909 host target gene. RBBP9

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:34742, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34392] Another function of VGAM909 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM\_046553). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. Signal Transducer and Activator of Transcription 1, 91kDa (STAT1, Accession NM\_007315) is another VGAM909 host target gene. STAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT1 BINDING SITE, designated SEQ ID:14231, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ

ID:3620.

[34393] Another function of VGAM909 is therefore inhibition of Signal Transducer and Activator of Transcription 1, 91kDa (STAT1, Accession NM\_007315), a gene which is involved in transcriptional regulation. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT1. The function of STAT1 has been established by previous studies. STAT proteins have the dual function of signal transduction and activation of transcription (Darnell et al., 1994). These proteins are activated by phosphorylation on tyrosine in response to different ligands after which they form homodimers or heterodimers that translocate to the cell nucleus where they either directly bind to DNA or act together with other DNA-binding proteins in multiprotein transcription complexes to direct transcription. The first of these proteins to be described, which they termed STAT1 (for signal transduction and activator of transcription-1), is activated by a number of different ligands, including interferon-alpha (IFNA; 147660), interferon-gamma (IFNG; 147570), EGF (OMIM Ref. No. 131530), PDGF (see OMIM Ref. No. 173430), and IL6 (OMIM Ref. No. 147620). The same tyrosine residue is activated at least

by IFN- $\alpha$ , IFN- $\gamma$ , and EGF. STAT2 (OMIM Ref. No. 600556), in contrast, is activated by IFN- $\alpha$  but not by IFN- $\gamma$  or any of the other ligands mentioned above. STAT3 is known to be activated by IGF, IL6, LIF, and perhaps other ligands but is not activated by IFN- $\gamma$ . STAT4 (OMIM Ref. No. 600558) is present in high concentration in the testis but has not been found in a phosphorylated form in cells. The STAT proteins differ in the DNA sites to which they bind. STAT1 homodimer binds to a site termed GAS, first defined as required for IFN- $\gamma$  induction. Variations on this site are also used in response to IL6, PDGF, and other ligands. Animal model experiments lend further support to the function of STAT1. Meraz et al. (1996) reported the generation and characterization of mice deficient in Stat1. Stat1-deficient mice showed no overt development abnormalities but displayed a complete lack of responsiveness to either interferon- $\alpha$  or interferon- $\gamma$  and were highly sensitive to infection by microbial pathogens and viruses. In contrast, these mice responded normally to several other cytokines that activate Stat1 in vitro. These observations documented that STAT1 plays an obligate and dedicated role in mediating IFN-dependent biologic responses and revealed

an unexpected level of physiologic specificity for STAT1 action.

[34394] It is appreciated that the abovementioned animal model for STAT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[34395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34396] Darnell, J. E., Jr.; Kerr, I. M.; Stark, G. M. : Jak-STAT pathways and transcriptional activation in response to IFNs and other extracellular signaling proteins. Science 264: 1415-1421, 1994. ; and

[34397] Meraz, M. A.; White, J. M.; Sheehan, K. C. F.; Bach, E. A.; Rodig, S. J.; Dighe, A. S.; Kaplan, D. H.; Riley, J. K.; Greenlund, A. C. Campbell, D.; Carver-Moore, K.; DuBois, R. N.; Clar.

[34398] Further studies establishing the function and utilities of STAT1 are found in John Hopkins OMIM database record ID 600555, and in cited publications numbered 8095-8097, 6079, 8098-8100, 11676, 12053-8103, 168 and 12330 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIM3

(Accession NM\_032782) is another VGAM909 host target gene. TIM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIM3 BINDING SITE, designated SEQ ID:26524, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34399] Another function of VGAM909 is therefore inhibition of TIM3 (Accession NM\_032782), a gene which regulates macrophage activation and enhances the severity of experimental autoimmune encephalomyelitis in mice. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM3. The function of TIM3 has been established by previous studies. By immunoscreening Th1 and Th2 cells with monoclonal antibodies derived from mouse Th1 cell-immunized rats, followed by gene-expression cloning, Monney et al. (2002) obtained a cDNA encoding mouse Tim3. By genomic database searching and RT-PCR, the authors isolated a cDNA encoding human TIM3. The deduced 301-amino acid type I membrane protein, 63%

identical overall and 77% identical in the cytoplasmic domain, has an Ig variable-like domain, a mucin-like domain consisting of 31% serine and threonine residues, and a cytoplasmic domain with a tyrosine phosphorylation motif. Monney et al. (2002) noted that TIM3 is related to the hepatitis A virus cellular receptor (HAVCR1; 606518), also known as the kidney injury molecule (Kim1). Using flow cytometric and RT-PCR analysis, Monney et al. (2002) detected Tim3 only on activated Th1 cells and CD11b+ (ITGAM; 120980) macrophages. Cells expressing Tim3 predominate in the central nervous system of mice at the onset of experimental autoimmune encephalomyelitis (EAE), a Th1-mediated autoimmune disease. Anti-Tim3 treatment enhanced the clinical and pathologic severity of EAE and increased the number and activation level of macrophages. Monney et al. (2002) proposed that anti-Tim3 may trigger the production of proinflammatory cytokines in vivo and induce macrophage activation possibly by enhancing the migration of Th1 cells into the brain or by blocking an interaction between Tim3 and an inhibitory ligand.

[34400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [34401] Monney, L.; Sabatos, C.; Gaglia, J. L.; Ryu, A.; Waldner, H.; Chernova, T.; Manning, S.; Greenfield, E. A.; Coyle, A. J.; Sobel, R. A.; Freeman, G. J.; Kuchroo, V. K. : Th1-specific cell surface protein regulates macrophage activation and severity of an autoimmune disease. *Nature* 415: 536–541, 2002. ; and
- [34402] McIntire, J. J.; Umetsu, S. E.; Akbari, O.; Potter, M.; Kuchroo, V. K.; Barsh, G. S.; Freeman, G. J.; Umetsu, D. T.; DeKruyff, R. H. : Identification of Tapr (an airway hyperre-activity.
- [34403] Further studies establishing the function and utilities of TIM3 are found in John Hopkins OMIM database record ID 606652, and in cited publications numbered 6839 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bifunctional Apoptosis Regulator (BFAR, Accession XM\_027311) is another VGAM909 host target gene. BFAR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BFAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BFAR BINDING SITE,

designated SEQ ID:30478, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34404] Another function of VGAM909 is therefore inhibition of Bifunctional Apoptosis Regulator (BFAR, Accession XM\_027311). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BFAR. CMRF-35H (Accession XM\_046925) is another VGAM909 host target gene. CMRF-35H BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMRF-35H, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMRF-35H BINDING SITE, designated SEQ ID:34862, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34405] Another function of VGAM909 is therefore inhibition of CMRF-35H (Accession XM\_046925). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMRF-35H. Cleavage and Polyadenylation Specific Factor 2,

100kDa (CPSF2, Accession XM\_029311) is another VGAM909 host target gene. CPSF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CPSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE, designated SEQ ID:30863, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34406] Another function of VGAM909 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM\_029311). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2. DKFZP564D0764 (Accession XM\_113964) is another VGAM909 host target gene. DKFZP564D0764 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D0764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0764 BINDING SITE, designated

SEQ ID:42574, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34407] Another function of VGAM909 is therefore inhibition of DKFZP564D0764 (Accession XM\_113964). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0764. FLJ10697 (Accession NM\_018181) is another VGAM909 host target gene. FLJ10697 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10697 BINDING SITE, designated SEQ ID:20016, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34408] Another function of VGAM909 is therefore inhibition of FLJ10697 (Accession NM\_018181). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10697. FLJ10704 (Accession NM\_018185) is another VGAM909 host target gene. FLJ10704 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:20030, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34409] Another function of VGAM909 is therefore inhibition of FLJ10704 (Accession NM\_018185). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ11722 (Accession NM\_024970) is another VGAM909 host target gene. FLJ11722 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11722 BINDING SITE, designated SEQ ID:24521, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34410] Another function of VGAM909 is therefore inhibition of

FLJ11722 (Accession NM\_024970). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11722. KIAA0335 (Accession NM\_014803) is another VGAM909 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16734, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34411] Another function of VGAM909 is therefore inhibition of KIAA0335 (Accession NM\_014803). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA0976 (Accession NM\_014917) is another VGAM909 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17162, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34412] Another function of VGAM909 is therefore inhibition of KIAA0976 (Accession NM\_014917). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. KIAA1727 (Accession XM\_034262) is another VGAM909 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32031, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34413] Another function of VGAM909 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1938 (Accession XM\_166407) is another

VGAM909 host target gene. KIAA1938 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1938 BINDING SITE, designated SEQ ID:44279, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34414] Another function of VGAM909 is therefore inhibition of KIAA1938 (Accession XM\_166407). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1938. SEC15L (Accession XM\_051147) is another VGAM909 host target gene. SEC15L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC15L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15L BINDING SITE, designated SEQ ID:35765, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34415] Another function of VGAM909 is therefore inhibition of SEC15L (Accession XM\_051147). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15L. TSPAN-2 (Accession NM\_005725) is another VGAM909 host target gene. TSPAN-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPAN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPAN-2 BINDING SITE, designated SEQ ID:12278, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34416] Another function of VGAM909 is therefore inhibition of TSPAN-2 (Accession NM\_005725). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPAN-2. Zinc Finger Protein 297B (ZNF297B, Accession NM\_014007) is another VGAM909 host target gene. ZNF297B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF297B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE, designated SEQ ID:15220, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34417] Another function of VGAM909 is therefore inhibition of Zinc Finger Protein 297B (ZNF297B, Accession NM\_014007). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B. LOC143879 (Accession XM\_084666) is another VGAM909 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37659, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34418] Another function of VGAM909 is therefore inhibition of LOC143879 (Accession XM\_084666). Accordingly, utilities

of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC151057 (Accession XM\_097998) is another VGAM909 host target gene. LOC151057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151057 BINDING SITE, designated SEQ ID:41294, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34419] Another function of VGAM909 is therefore inhibition of LOC151057 (Accession XM\_097998). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151057. LOC199957 (Accession XM\_114068) is another VGAM909 host target gene. LOC199957 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC199957 BINDING SITE, designated SEQ ID:42674, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34420] Another function of VGAM909 is therefore inhibition of LOC199957 (Accession XM\_114068). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. LOC202934 (Accession XM\_117486) is another VGAM909 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43460, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34421] Another function of VGAM909 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC253612 (Accession XM\_172985) is another VGAM909 host target gene. LOC253612 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by LOC253612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253612 BINDING SITE, designated SEQ ID:46255, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34422] Another function of VGAM909 is therefore inhibition of LOC253612 (Accession XM\_172985). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253612. LOC257017 (Accession XM\_173227) is another VGAM909 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46491, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34423] Another function of VGAM909 is therefore inhibition of

LOC257017 (Accession XM\_173227). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC92573 (Accession XM\_045884) is another VGAM909 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34599, to the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, also designated SEQ ID:3620.

[34424] Another function of VGAM909 is therefore inhibition of LOC92573 (Accession XM\_045884). Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 910 (VGAM910) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[34425] VGAM910 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM910 was detected is described hereinabove with reference to Figs. 1–8.

[34426] VGAM910 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34427] VGAM910 gene encodes a VGAM910 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM910 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM910 precursor RNA is designated SEQ ID:896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:896 is located at position 61092 relative to the genome of Alcelaphine Herpesvirus 1.

[34428] VGAM910 precursor RNA folds onto itself, forming VGAM910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[34429] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM910 folded precursor RNA into VGAM910 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 70%) nucleotide se-  
quence of VGAM910 RNA is designated SEQ ID:3621, and  
is provided hereinbelow with reference to the sequence  
listing part.

[34430] VGAM910 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM910 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM910 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[34431] VGAM910 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM910 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM910 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[34432] The complementary binding of VGAM910 RNA, herein designated VGAM RNA, to host target binding sites on VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM910 host target RNA into VGAM910 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34433] It is appreciated that VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM910 host target genes. The mRNA of each one of this plurality of VGAM910 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM910 RNA, herein designated VGAM RNA, and which when bound by VGAM910 RNA causes inhibition of translation of respective one or more VGAM910 host target proteins.

[34434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM910 gene, herein designated VGAM GENE, on one or

more VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34435] It is yet further appreciated that a function of VGAM910 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM910 correlate with, and may be deduced from, the identity of the host target genes which VGAM910 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [34436] Nucleotide sequences of the VGAM910 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM910 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM910 are further described hereinbelow with reference to Table 1.
- [34437] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM910 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM910 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [34438] As mentioned hereinabove with reference to Fig. 1, a function of VGAM910 gene, herein designated VGAM is inhibition of expression of VGAM910 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM910 correlate with, and may be deduced from, the identity of the target genes which VGAM910 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [34439] Bone Morphogenetic Protein 4 (BMP4, Accession

NM\_001202) is a VGAM910 host target gene. BMP4 BINDING SITE1 through BMP4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BMP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP4 BINDING SITE1 through BMP4 BINDING SITE3, designated SEQ ID:6867, SEQ ID:28388 and SEQ ID:28389 respectively, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34440] A function of VGAM910 is therefore inhibition of Bone Morphogenetic Protein 4 (BMP4, Accession NM\_001202), a gene which acts in mesoderm induction, tooth development, limb formation and fracture repair. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP4. The function of BMP4 has been established by previous studies. Shafritz et al. (1996) found overexpression of BMP4 in lymphoblastoid cell lines from 26 of 32 patients with fibrodysplasia ossificans progressiva (FOP; 135100), but from only 1 of 12 normal subjects (P less than 0.001). Furthermore, BMP4 and its mRNA were de-

tected in the lymphoblastoid cell lines from a man with FOP and his 3 affected children, but not from the children's unaffected mother. Cosegregation of DNA markers for the BMP4 locus on chromosome 14 in the rare families in which FOP is inherited would strengthen the candidacy of BMP4, and the demonstration of mutations in the BMP4 gene, especially in the promoter sequences, would be confirmatory. Animal model experiments lend further support to the function of BMP4. Connor (1996) speculated that transgenic mice with selective overexpression of BMP4 may serve as animal models of FOP and may make it possible to evaluate potential therapies directed at influencing the expression of BMP4 or its 2 types of cell-surface receptors. Not only may this knowledge provide a rational basis for therapy for FOP, but possibly also measures for the control of local ectopic bone development which occurs in 10 to 20% of patients who have undergone surgical hip replacement. According to Connor (1996), there appears to be an individual propensity to the phenomenon of secondary ectopic ossification of soft tissue. In the 10 to 20% of patients who develop local ectopic bone formation after hip replacement, if surgical removal of that bone is attempted or the opposite hip is re-

placed, ectopic bone almost invariably recurs or occurs.

[34441] It is appreciated that the abovementioned animal model for BMP4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[34442] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34443] Shafritz, A. B.; Shore, E. M.; Gannon, F. H.; Zasloff, M. A.; Taub, R.; Muenke, M.; Kaplan, F. S. : Overexpression of an osteogenic morphogen in fibrodysplasia ossificans progressiva. New Eng. J. Med. 335: 555–561, 1996. ; and

[34444] Connor, J. M. : Fibrodysplasia ossificans progressiva: lessons from rare maladies. (Editorial) New Eng. J. Med. 335: 591–593, 1996.

[34445] Further studies establishing the function and utilities of BMP4 are found in John Hopkins OMIM database record ID 112262, and in cited publications numbered 1163 and 11632–11639 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM\_000132) is another VGAM910 host target gene. F8 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5616, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34446] Another function of VGAM910 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM\_000132). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878) is another VGAM910 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6573, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34447] Another function of VGAM910 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. Keratin, Hair, Acidic, 8 (KRTHA8, Accession NM\_006771) is another VGAM910 host target gene. KRTHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KRTHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTHA8 BINDING SITE, designated SEQ ID:13644, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34448] Another function of VGAM910 is therefore inhibition of Keratin, Hair, Acidic, 8 (KRTHA8, Accession NM\_006771), a gene which is a type I keratin that may form intermediate

filaments. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTHA8. The function of KRTHA8 has been established by previous studies. Rogers et al. (1998) isolated and characterized 2 overlapping human PAC clones that cover 190 kb on 17q12–q21. These clones contain 9 type I hair keratin genes, including the novel genes KRTHA7 (OMIM Ref. No. 604541) and KRTHA8; 1 transcribed hair keratin pseudogene; and 1 orphan exon. The order of the genes is 5–prime--KRTHA6 (OMIM Ref. No. 604540)--KRTHA5 (OMIM Ref. No. 602764)--KRTHA2 (OMIM Ref. No. 602760)--orphan exon--KRTHA8--KRTHA7--pseudogene--KRTHA1--KRTHA4 (OMIM Ref. No. 602763)--KRTHA3B (OMIM Ref. No. 602762)--KRTHA3A (OMIM Ref. No. 602761)--3–prime. The hair keratin genes range in size from 4.2 to 7.5 kb, and the genes are separated from each other by 5.5 to 18.4 kb; all are located within about 140 kb. Each gene is transcribed from the 5–prime to 3–prime direction. Based on sequence homologies, the genes can be grouped into 3 subclusters of tandemly arranged genes. One subcluster, group A, consists of KRTHA1, KRTHA3A, KRTHA3B, and

KRTHA4, which share 89% overall amino acid identity. A second subcluster, group B, contains KRTHA7 and KRTHA8, as well as the hair keratin pseudogene, which the authors called HAA. The functional hair keratins and hypothetical HAA hair keratin share approximately 81% overall amino acid identity. Due to an almost completely identical head domain, KRTHA7 and KRTHA8 are 92.6% identical. The third subcluster, group C, consists of the structurally less related hair keratins KRTHA2, KRTHA5, and KRTHA6, which share about 70% amino acid identity. Rogers et al. (1998) found that the deduced KRTHA8 protein, which they called HA8, has 415 amino acids. The KRTHA8 gene contains 7 exons. By RT-PCR, Rogers et al. (1998) showed that KRTHA8 is expressed in the human hair follicle. See Langbein et al. (1999) for further details on the expression pattern of the KRTHA8 gene in the hair follicle.

[34449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34450] Langbein, L.; Rogers, M. A.; Winter, H.; Silke, P.; Beckhaus, U.; Rackwitz, H.-R.; Schweizer, J. : The catalog of human hair keratins. I. Expression of the nine type I members in

the hair follicle. J. Biol. Chem. 274: 19874–19884, 1999. ;  
and

[34451] Rogers, M. A.; Winter, H.; Wolf, C.; Heck, M.; Schweizer, J. :  
Characterization of a 190–kilobase pair domain of human  
type I hair keratin genes. J. Biol. Chem. 273:  
26683–26691, 1998.

[34452] Further studies establishing the function and utilities of  
KRTHA8 are found in John Hopkins OMIM database record  
ID 604542, and in cited publications numbered  
1257–1258 listed in the bibliography section hereinbelow,  
which are also hereby incorporated by refer-  
ence. Mesenchyme Homeo Box 2 (growth arrest–specific  
homeo box) (MEOX2, Accession NM\_005924) is another  
VGAM910 host target gene. MEOX2 BINDING SITE is HOST  
TARGET binding site found in the 3` untranslated region  
of mRNA encoded by MEOX2, corresponding to a HOST  
TARGET binding site such as BINDING SITE I, BINDING SITE  
II or BINDING SITE III. Table 2 illustrates the complemen-  
tarity of the nucleotide sequences of MEOX2 BINDING  
SITE, designated SEQ ID:12548, to the nucleotide se-  
quence of VGAM910 RNA, herein designated VGAM RNA,  
also designated SEQ ID:3621.

[34453] Another function of VGAM910 is therefore inhibition of

Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924), a gene which roles in mesoderm induction and, somitogenesis, and myogenic and sclerotomal differentiation. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEOX2. The function of MEOX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620) is another VGAM910 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6228, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34454] Another function of VGAM910 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM\_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions

throughout the body. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424) is another VGAM910 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44318, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34455] Another function of VGAM910 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. Sclerosteosis (SOST, Accession NM\_025237) is another

VGAM910 host target gene. SOST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOST BINDING SITE, designated SEQ ID:24918, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34456] Another function of VGAM910 is therefore inhibition of Sclerosteosis (SOST, Accession NM\_025237). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOST. Angiomotin (AMOT, Accession NM\_133265) is another VGAM910 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28414, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34457] Another function of VGAM910 is therefore inhibition of Angiomotin (AMOT, Accession NM\_133265). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM\_007077) is another VGAM910 host target gene. AP4S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP4S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP4S1 BINDING SITE, designated SEQ ID:13942, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34458] Another function of VGAM910 is therefore inhibition of Adaptor-related Protein Complex 4, Sigma 1 Subunit (AP4S1, Accession NM\_007077). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP4S1. DKFZP434N161 (Accession XM\_085920) is another VGAM910 host target gene. DKFZP434N161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DKFZP434N161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N161 BINDING SITE, designated SEQ ID:38396, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34459] Another function of VGAM910 is therefore inhibition of DKFZP434N161 (Accession XM\_085920). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N161. FLJ11004 (Accession NM\_018296) is another VGAM910 host target gene. FLJ11004 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11004 BINDING SITE, designated SEQ ID:20285, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34460] Another function of VGAM910 is therefore inhibition of FLJ11004 (Accession NM\_018296). Accordingly, utilities of

VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11004. FLJ11560 (Accession NM\_025182) is another VGAM910 host target gene. FLJ11560 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11560 BINDING SITE, designated SEQ ID:24819, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34461] Another function of VGAM910 is therefore inhibition of FLJ11560 (Accession NM\_025182). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11560. FLJ13263 (Accession NM\_025125) is another VGAM910 host target gene. FLJ13263 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13263 BINDING SITE,

designated SEQ ID:24768, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34462] Another function of VGAM910 is therefore inhibition of FLJ13263 (Accession NM\_025125). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13263. IMPACT (Accession NM\_018439) is another VGAM910 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20503, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34463] Another function of VGAM910 is therefore inhibition of IMPACT (Accession NM\_018439). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT. KIAA1157 (Accession XM\_051093) is another VGAM910 host target gene. KIAA1157 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35750, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34464] Another function of VGAM910 is therefore inhibition of KIAA1157 (Accession XM\_051093). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. KIAA1170 (Accession XM\_045907) is another VGAM910 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34610, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34465] Another function of VGAM910 is therefore inhibition of

KIAA1170 (Accession XM\_045907). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1276 (Accession XM\_039169) is another VGAM910 host target gene. KIAA1276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1276 BINDING SITE, designated SEQ ID:33018, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34466] Another function of VGAM910 is therefore inhibition of KIAA1276 (Accession XM\_039169). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1276. KIAA1937 (Accession XM\_057107) is another VGAM910 host target gene. KIAA1937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1937 BINDING SITE, designated SEQ ID:36484, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34467] Another function of VGAM910 is therefore inhibition of KIAA1937 (Accession XM\_057107). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1937. LCE (Accession NM\_024090) is another VGAM910 host target gene. LCE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LCE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCE BINDING SITE, designated SEQ ID:23534, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34468] Another function of VGAM910 is therefore inhibition of LCE (Accession NM\_024090). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCE. MAD4 (Accession NM\_006454) is another VGAM910 host

target gene. MAD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD4 BINDING SITE, designated SEQ ID:13168, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34469] Another function of VGAM910 is therefore inhibition of MAD4 (Accession NM\_006454). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD4. RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949) is another VGAM910 host target gene. RAS-GRP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASGRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP4 BINDING SITE, designated SEQ ID:27503, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ

ID:3621.

[34470] Another function of VGAM910 is therefore inhibition of RAS Guanyl Releasing Protein 4 (RASGRP4, Accession NM\_052949). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP4. LOC127262 (Accession XM\_072073) is another VGAM910 host target gene. LOC127262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127262 BINDING SITE, designated SEQ ID:37458, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34471] Another function of VGAM910 is therefore inhibition of LOC127262 (Accession XM\_072073). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127262. LOC137075 (Accession XM\_059895) is another VGAM910 host target gene. LOC137075 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC137075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137075 BINDING SITE, designated SEQ ID:37103, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34472] Another function of VGAM910 is therefore inhibition of LOC137075 (Accession XM\_059895). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137075. LOC153688 (Accession XM\_098416) is another VGAM910 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41655, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34473] Another function of VGAM910 is therefore inhibition of LOC153688 (Accession XM\_098416). Accordingly, utilities

of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC158972 (Accession XM\_099009) is another VGAM910 host target gene. LOC158972 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158972 BINDING SITE, designated SEQ ID:42042, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34474] Another function of VGAM910 is therefore inhibition of LOC158972 (Accession XM\_099009). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158972. LOC196540 (Accession XM\_116933) is another VGAM910 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196540 BINDING SITE, designated SEQ ID:43151, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34475] Another function of VGAM910 is therefore inhibition of LOC196540 (Accession XM\_116933). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC221832 (Accession XM\_166496) is another VGAM910 host target gene. LOC221832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221832 BINDING SITE, designated SEQ ID:44426, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34476] Another function of VGAM910 is therefore inhibition of LOC221832 (Accession XM\_166496). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221832. LOC255465 (Accession XM\_173206) is another VGAM910 host target gene. LOC255465 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46453, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34477] Another function of VGAM910 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC57109 (Accession NM\_020385) is another VGAM910 host target gene. LOC57109 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57109 BINDING SITE, designated SEQ ID:21655, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34478] Another function of VGAM910 is therefore inhibition of

LOC57109 (Accession NM\_020385). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57109. LOC90538 (Accession XM\_032401) is another VGAM910 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90538 BINDING SITE, designated SEQ ID:31656, to the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, also designated SEQ ID:3621.

[34479] Another function of VGAM910 is therefore inhibition of LOC90538 (Accession XM\_032401). Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 911 (VGAM911) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[34480] VGAM911 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM911 was detected is described hereinabove with reference to Figs. 1–8.

[34481] VGAM911 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34482] VGAM911 gene encodes a VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM911 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM911 precursor RNA is designated SEQ ID:897, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:897 is located at position 56711 relative to the genome of Human Herpesvirus 8.

[34483] VGAM911 precursor RNA folds onto itself, forming VGAM911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[34484] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM911 folded precursor RNA into VGAM911 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 81%) nucleotide se-  
quence of VGAM911 RNA is designated SEQ ID:3622, and  
is provided hereinbelow with reference to the sequence  
listing part.

[34485] VGAM911 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM911 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM911 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[34486] VGAM911 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM911 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM911 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[34487] The complementary binding of VGAM911 RNA, herein designated VGAM RNA, to host target binding sites on VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM911 host target RNA into VGAM911 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34488] It is appreciated that VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM911 host target genes. The mRNA of each one of this plurality of VGAM911 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM911 RNA, herein designated VGAM RNA, and which when bound by VGAM911 RNA causes inhibition of translation of respective one or more VGAM911 host target proteins.

[34489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM911 gene, herein designated VGAM GENE, on one or

more VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34490] It is yet further appreciated that a function of VGAM911 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM911 correlate with, and may be deduced from, the identity of the host target genes which VGAM911 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [34491] Nucleotide sequences of the VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM911 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM911 are further described hereinbelow with reference to Table 1.
- [34492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM911 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM911 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [34493] As mentioned hereinabove with reference to Fig. 1, a function of VGAM911 gene, herein designated VGAM is inhibition of expression of VGAM911 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM911 correlate with, and may be deduced from, the identity of the target genes which VGAM911 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [34494] Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Acces-

sion NM\_004360) is a VGAM911 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10562, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34495] A function of VGAM911 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM\_004360). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243) is another VGAM911 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG1 BINDING SITE, designated SEQ ID:29967, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA,

also designated SEQ ID:3622.

[34496] Another function of VGAM911 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243), a gene which may have a growth inhibitory role. Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM\_021021) is another VGAM911 host target gene. SNTB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB1 BINDING SITE, designated SEQ ID:22012, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34497] Another function of VGAM911 is therefore inhibition of

Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM\_021021). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB1. Zinc Finger Protein 138 (clone pHZ-32) (ZNF138, Accession XM\_088081) is another VGAM911 host target gene. ZNF138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF138 BINDING SITE, designated SEQ ID:39508, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34498] Another function of VGAM911 is therefore inhibition of Zinc Finger Protein 138 (clone pHZ-32) (ZNF138, Accession XM\_088081). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF138. AOP2 (Accession NM\_004905) is another VGAM911 host target gene. AOP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

AOP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOP2 BINDING SITE, designated SEQ ID:11341, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34499] Another function of VGAM911 is therefore inhibition of AOP2 (Accession NM\_004905). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOP2. BCL2-like 12 (proline rich) (BCL2L12, Accession NM\_138639) is another VGAM911 host target gene. BCL2L12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL2L12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L12 BINDING SITE, designated SEQ ID:28915, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34500] Another function of VGAM911 is therefore inhibition of BCL2-like 12 (proline rich) (BCL2L12, Accession

NM\_138639). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L12. FLJ14129 (Accession NM\_030895) is another VGAM911 host target gene. FLJ14129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14129 BINDING SITE, designated SEQ ID:25164, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34501] Another function of VGAM911 is therefore inhibition of FLJ14129 (Accession NM\_030895). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14129. HSPC043 (Accession XM\_041943) is another VGAM911 host target gene. HSPC043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HSPC043 BINDING SITE, designated SEQ ID:33637, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34502] Another function of VGAM911 is therefore inhibition of HSPC043 (Accession XM\_041943). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC043. LOC199796 (Accession XM\_058994) is another VGAM911 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36810, to the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, also designated SEQ ID:3622.

[34503] Another function of VGAM911 is therefore inhibition of LOC199796 (Accession XM\_058994). Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 912 (VGAM912) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34504] VGAM912 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM912 was detected is described hereinabove with reference to Figs. 1–8.

[34505] VGAM912 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34506] VGAM912 gene encodes a VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM912 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM912 precursor RNA is designated SEQ ID:898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:898 is

located at position 58652 relative to the genome of Human Herpesvirus 8.

[34507] VGAM912 precursor RNA folds onto itself, forming VGAM912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34508] An enzyme complex designated DICER COMPLEX, `dices` the VGAM912 folded precursor RNA into VGAM912 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM912 RNA is designated SEQ ID:3623, and is provided hereinbelow with reference to the sequence listing part.

[34509] VGAM912 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM912 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[34510] VGAM912 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM912 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM912 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM912 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34511] The complementary binding of VGAM912 RNA, herein designated VGAM RNA, to host target binding sites on VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM912 host target RNA into VGAM912 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34512] It is appreciated that VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM912 host target genes. The mRNA of each one of this plurality of VGAM912 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM912 RNA, herein designated VGAM RNA, and which when bound by VGAM912 RNA causes inhibition of translation of respective one or more VGAM912

host target proteins.

[34513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM912 gene, herein designated VGAM GENE, on one or more VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34514] It is yet further appreciated that a function of VGAM912 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Spe-

cific functions, and accordingly utilities, of VGAM912 correlate with, and may be deduced from, the identity of the host target genes which VGAM912 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [34515] Nucleotide sequences of the VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM912 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM912 are further described hereinbelow with reference to Table 1.
- [34516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM912 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM912 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [34517] As mentioned hereinabove with reference to Fig. 1, a function of VGAM912 gene, herein designated VGAM is inhibition of expression of VGAM912 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM912 correlate with, and may be deduced from, the identity of the target genes which VGAM912 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34518] Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM\_002424) is a VGAM912 host target gene. MMP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP8 BINDING SITE, designated SEQ ID:8258, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34519] A function of VGAM912 is therefore inhibition of Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM\_002424). Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP8. KIAA1024 (Accession XM\_044580) is another VGAM912 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34235, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34520] Another function of VGAM912 is therefore inhibition of KIAA1024 (Accession XM\_044580). Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. LOC145820 (Accession XM\_085246) is another VGAM912 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37992, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34521] Another function of VGAM912 is therefore inhibition of LOC145820 (Accession XM\_085246). Accordingly, utilities

of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC151248 (Accession XM\_087143) is another VGAM912 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39087, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34522] Another function of VGAM912 is therefore inhibition of LOC151248 (Accession XM\_087143). Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. LOC54550 (Accession XM\_085348) is another VGAM912 host target gene. LOC54550 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC54550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC54550 BINDING SITE, designated SEQ ID:38076, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34523] Another function of VGAM912 is therefore inhibition of LOC54550 (Accession XM\_085348). Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54550. LOC92539 (Accession XM\_045632) is another VGAM912 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34502, to the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, also designated SEQ ID:3623.

[34524] Another function of VGAM912 is therefore inhibition of LOC92539 (Accession XM\_045632). Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 913 (VGAM913) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34525] VGAM913 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM913 was detected is described hereinabove with reference to Figs. 1–8.

[34526] VGAM913 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos Latent Virus. VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34527] VGAM913 gene encodes a VGAM913 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM913 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM913 precursor RNA is designated SEQ ID:899, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:899 is located at position 2180 relative to the genome of Pothos

Latent Virus.

[34528] VGAM913 precursor RNA folds onto itself, forming VGAM913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34529] An enzyme complex designated DICER COMPLEX, `dices` the VGAM913 folded precursor RNA into VGAM913 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM913 RNA is designated SEQ ID:3624, and is provided hereinbelow with reference to the sequence listing part.

[34530] VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM913 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34531] VGAM913 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM913 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM913 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34532] The complementary binding of VGAM913 RNA, herein designated VGAM RNA, to host target binding sites on VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM913 host target RNA into VGAM913 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34533] It is appreciated that VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM913 host target genes. The mRNA of each one of this plurality of VGAM913 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM913 RNA, herein designated VGAM RNA, and which when bound by VGAM913 RNA causes inhibition of translation of respective one or more VGAM913 host target proteins.

[34534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM913 gene, herein designated VGAM GENE, on one or more VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34535] It is yet further appreciated that a function of VGAM913 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of viral infection by Pothos Latent Virus. Specific functions, and accordingly utilities, of VGAM913 correlate

with, and may be deduced from, the identity of the host target genes which VGAM913 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34536] Nucleotide sequences of the VGAM913 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM913 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM913 are further described hereinbelow with reference to Table 1.

[34537] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM913 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM913 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34538] As mentioned hereinabove with reference to Fig. 1, a function of VGAM913 gene, herein designated VGAM is inhibition of expression of VGAM913 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM913 correlate with, and may be deduced

from, the identity of the target genes which VGAM913 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34539] Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248) is a VGAM913 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21547, to the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, also designated SEQ ID:3624.

[34540] A function of VGAM913 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM\_020248). Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. Histidyl-tRNA Synthetase 2 (HARS2, Accession NM\_080820) is another VGAM913 host target gene. HARS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HARS2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HARS2 BINDING SITE, designated SEQ ID:28078, to the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, also designated SEQ ID:3624.

[34541] Another function of VGAM913 is therefore inhibition of Histidyl-tRNA Synthetase 2 (HARS2, Accession NM\_080820). Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HARS2. LOC118738 (Accession XM\_061125) is another VGAM913 host target gene. LOC118738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118738 BINDING SITE, designated SEQ ID:37196, to the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, also designated SEQ ID:3624.

[34542] Another function of VGAM913 is therefore inhibition of LOC118738 (Accession XM\_061125). Accordingly, utilities

of VGAM913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118738. LOC164684 (Accession XM\_092926) is another VGAM913 host target gene. LOC164684 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164684 BINDING SITE, designated SEQ ID:40159, to the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, also designated SEQ ID:3624.

[34543] Another function of VGAM913 is therefore inhibition of LOC164684 (Accession XM\_092926). Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164684. LOC170425 (Accession XM\_084330) is another VGAM913 host target gene. LOC170425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC170425 BINDING SITE, designated SEQ ID:37552, to the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, also designated SEQ ID:3624.

[34544] Another function of VGAM913 is therefore inhibition of LOC170425 (Accession XM\_084330). Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170425. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 914 (VGAM914) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34545] VGAM914 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM914 was detected is described hereinabove with reference to Figs. 1–8.

[34546] VGAM914 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos Latent Virus. VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34547] VGAM914 gene encodes a VGAM914 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM914 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM914 precursor RNA is designated SEQ ID:900, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:900 is located at position 2846 relative to the genome of Pothos Latent Virus.

[34548] VGAM914 precursor RNA folds onto itself, forming VGAM914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34549] An enzyme complex designated DICER COMPLEX, `dices` the VGAM914 folded precursor RNA into VGAM914 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM914 RNA is designated SEQ ID:3625, and is provided hereinbelow with reference to the sequence listing part.

[34550] VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM914 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34551] VGAM914 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM914 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM914 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34552] The complementary binding of VGAM914 RNA, herein designated VGAM RNA, to host target binding sites on VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM914 host target RNA into VGAM914 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34553] It is appreciated that VGAM914 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM914 host target genes. The mRNA of each one of this plurality of VGAM914 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM914 RNA, herein designated VGAM RNA, and which when bound by VGAM914 RNA causes inhibition of translation of respective one or more VGAM914 host target proteins.

[34554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM914 gene, herein designated VGAM GENE, on one or more VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[34555] It is yet further appreciated that a function of VGAM914 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of viral infection by Pothos Latent Virus. Specific functions, and accordingly utilities, of VGAM914 correlate with, and may be deduced from, the identity of the host target genes which VGAM914 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34556] Nucleotide sequences of the VGAM914 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM914 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM914 are further described hereinbelow with reference to Table 1.

[34557] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM914 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM914 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34558] As mentioned hereinabove with reference to Fig. 1, a function of VGAM914 gene, herein designated VGAM is inhibition of expression of VGAM914 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM914 correlate with, and may be deduced from, the identity of the target genes which VGAM914 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34559] Phosphoribosyl Pyrophosphate Synthetase-associated Protein 1 (PRPSAP1, Accession NM\_002766) is a VGAM914 host target gene. PRPSAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPSAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPSAP1 BINDING SITE, designated SEQ ID:8660, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34560] A function of VGAM914 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase-associated Protein 1 (PRPSAP1, Accession NM\_002766), a gene which catalyzes the formation of PRPP from ATP and ribose 5-phosphate. Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPSAP1. The function of PRPSAP1 has been established by previous studies. Phosphoribosylpyrophosphate (PRPP) synthetase catalyzes the formation of PRPP from ATP and ribose 5-phosphate. Ishizuka et al. (1996) noted that the rat liver enzyme exists as complex aggregates of 34-, 39-, and 41-kD components, with the 34-kD species being the catalytic subunit. The 34-kD subunit from rat liver is a mixture of 2 highly homologous isoforms, PRS I and PRS II. The PRS I and PRS II mRNAs are encoded by 2 distinct genes, designated Prps1 and Prps2. The human PRPS1 (OMIM Ref. No. 311850) and PRPS2 (OMIM Ref. No. 311860) genes are located in different regions of the X chromosome, Xq22-q24 and Xp22.3-p22.2, respectively. The 39- and 41-kD components of these enzymes are termed PRPP synthetase-associated proteins (PAPs). The human 41-kD component, PAP41, is encoded by the PRPSAP2 gene

(OMIM Ref. No. 603762). Since Kita et al. (1994) showed that removal of the Paps from the rat liver enzyme complex led to an increase in enzyme activity of the remaining catalytic subunits, they proposed that Paps have a negative regulatory role in PRPP synthesis. Kita et al. (1994) cloned the cDNA for the 39-kD component (Pap39) from rat liver. The deduced amino acid sequence was remarkably similar to those of the 34-kD subunits. Using a PCR strategy with primers based on the sequence of the rat Pap39 protein, Ishizuka et al. (1996) cloned cDNAs encoding human PAP39. The deduced 356-amino acid human protein shares 98% identity with rat Pap39 and 44% identity with human PRS I and PRS II. Northern blot analysis revealed that PAP39 was expressed as a 2.2-kb mRNA in all human tissues tested. Ishizuka et al. (1996) mapped the human PRPSAP1 gene to 17q24-q25 by PCR analysis of somatic cell hybrids and by fluorescence in situ hybridization.

[34561] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34562] Ishizuka, T.; Ahmad, I.; Kita, K.; Sonoda, T.; Ishijima, S.; Sawa, K.; Suzuki, N.; Tatibana, M. : The human phosphori-

bosylpyrophosphate synthetase-associated protein 39 gene (PRPSAP1) is located in the chromosome region 17q24-q25. Genomics 33: 332-334, 1996. ; and

[34563] Ishizuka, T.; Kita, K.; Sonoda, T.; Ishijima, S.; Sawa, K.; Suzuki, N.; Tatibana, M. : Cloning and sequencing of human complementary DNA for the phosphoribosylpyrophosphate synthetase-as.

[34564] Further studies establishing the function and utilities of PRPSAP1 are found in John Hopkins OMIM database record ID 601249, and in cited publications numbered 9380-9382 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAP1B, Member of RAS Oncogene Family (RAP1B, Accession NM\_015646) is another VGAM914 host target gene. RAP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1B BINDING SITE, designated SEQ ID:17897, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34565] Another function of VGAM914 is therefore inhibition of RAP1B, Member of RAS Oncogene Family (RAP1B, Accession NM\_015646), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1B. The function of RAP1B has been established by previous studies. Three human cDNAs encoding 'new' RAS-related proteins, designated RAP1A, RAP1B, and RAP2, were isolated by Pizon et al. (1988). These proteins share approximately 50% amino acid identity with the classical RAS proteins and have numerous structural features in common. The most striking difference between the RAP and RAS proteins resides in their 61st amino acid: glutamine in RAS is replaced by threonine in RAP proteins. Animal model experiments lend further support to the function of RAP1B. Using mice transgenic for constitutive expression of Rap1a within the T cell lineage, Sebzda et al. (2002) found that instead of anergy, these T cells showed enhanced T cell receptor-mediated responses, both in thymocytes and in mature T cells. In addition, Rap1a activation induces strong activation of beta-1 (OMIM Ref. No. 135630) and beta-2 (OMIM

Ref. No. 600065) integrins. The authors concluded that Rap1a positively influences T cells by augmenting their responses and directing integrin activation.

[34566] It is appreciated that the abovementioned animal model for RAP1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[34567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34568] Pizon, V.; Chardin, P.; Lerosey, I.; Olofsson, B.; Tavitian, A. : Human cDNAs RAP1 and RAP2 homologous to the Drosophila gene Dras3 encode proteins closely related to ras in the 'effector' region. Oncogene 3: 201–204, 1988. ; and

[34569] Kitayama, H.; Sugimoto, Y.; Matsuzaki, T.; Ikawa, Y.; Noda, M. : A ras–related gene with transformation suppressor activity. Cell 56: 77–84, 1989. PubMed ID : 2642744 9. Sebzda, E.; Brac.

[34570] Further studies establishing the function and utilities of RAP1B are found in John Hopkins OMIM database record ID 179530, and in cited publications numbered listed in the bibliography section hereinbelow, which are also

hereby incorporated by reference. KIAA0316 (Accession XM\_045712) is another VGAM914 host target gene.

KIAA0316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0316 BINDING SITE, designated SEQ ID:34529, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34571] Another function of VGAM914 is therefore inhibition of KIAA0316 (Accession XM\_045712). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0316. LOC149271 (Accession XM\_086475) is another VGAM914 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38681, to

the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34572] Another function of VGAM914 is therefore inhibition of LOC149271 (Accession XM\_086475). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC149372 (Accession XM\_086509) is another VGAM914 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38730, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34573] Another function of VGAM914 is therefore inhibition of LOC149372 (Accession XM\_086509). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC150245 (Accession XM\_097843) is another VGAM914 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41160, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34574] Another function of VGAM914 is therefore inhibition of LOC150245 (Accession XM\_097843). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC153416 (Accession XM\_018473) is another VGAM914 host target gene. LOC153416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153416 BINDING SITE, designated SEQ ID:30362, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34575] Another function of VGAM914 is therefore inhibition of LOC153416 (Accession XM\_018473). Accordingly, utilities

of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153416. LOC196500 (Accession XM\_113734) is another VGAM914 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42385, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34576] Another function of VGAM914 is therefore inhibition of LOC196500 (Accession XM\_113734). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC200317 (Accession XM\_114208) is another VGAM914 host target gene. LOC200317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200317 BINDING SITE, designated SEQ ID:42804, to the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, also designated SEQ ID:3625.

[34577] Another function of VGAM914 is therefore inhibition of LOC200317 (Accession XM\_114208). Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 915 (VGAM915) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34578] VGAM915 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM915 was detected is described hereinabove with reference to Figs. 1–8.

[34579] VGAM915 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichoplusia Ni Cytoplasmic Polyhedrosis Virus 15. VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34580] VGAM915 gene encodes a VGAM915 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM915 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM915 precursor RNA is designated SEQ ID:901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:901 is located at position 1864 relative to the genome of Tri-choplusia Ni Cytoplasmic Polyhedrosis Virus 15.

[34581] VGAM915 precursor RNA folds onto itself, forming VGAM915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34582] An enzyme complex designated DICER COMPLEX, `dices` the VGAM915 folded precursor RNA into VGAM915 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM915 RNA is designated SEQ ID:3626, and is provided hereinbelow with reference to the sequence listing part.

[34583] VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM915 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34584] VGAM915 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM915 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM915 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34585] The complementary binding of VGAM915 RNA, herein designated VGAM RNA, to host target binding sites on VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM915 host target RNA into VGAM915 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34586] It is appreciated that VGAM915 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM915 host target genes. The mRNA of each one of this plurality of VGAM915 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM915 RNA, herein designated VGAM RNA, and which when bound by VGAM915 RNA causes inhibition of translation of respective one or more VGAM915 host target proteins.

[34587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM915 gene, herein designated VGAM GENE, on one or more VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[34588] It is yet further appreciated that a function of VGAM915 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of viral infection by Trichoplusia Ni Cytoplasmic Polyhedrosis Virus 15. Specific functions, and accordingly utilities, of VGAM915 correlate with, and may be deduced from, the identity of the host target genes which VGAM915 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34589] Nucleotide sequences of the VGAM915 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM915 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM915 are further described hereinbelow with reference to Table 1.

[34590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM915 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM915 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34591] As mentioned hereinabove with reference to Fig. 1, a function of VGAM915 gene, herein designated VGAM is inhibition of expression of VGAM915 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM915 correlate with, and may be deduced from, the identity of the target genes which VGAM915 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34592] Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM\_022162) is a VGAM915 host target gene. CARD15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:22714, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34593] A function of VGAM915 is therefore inhibition of Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM\_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NFkB activation. Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD15. The function of CARD15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126. CD2-associated Protein (CD2AP, Accession NM\_012120) is another VGAM915 host target gene. CD2AP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD2AP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:14432, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34594] Another function of VGAM915 is therefore inhibition of CD2-associated Protein (CD2AP, Accession NM\_012120),

a gene which binds CAS ligand and may therefore involve in its growth regulatory pathway. Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP. The function of CD2AP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Galactosylceramidase (Krabbe disease) (GALC, Accession NM\_000153) is another VGAM915 host target gene. GALC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALC BINDING SITE, designated SEQ ID:5663, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34595] Another function of VGAM915 is therefore inhibition of Galactosylceramidase (Krabbe disease) (GALC, Accession NM\_000153), a gene which hydrolyses the galactose ester bonds of galactosylceramide, galactosylsphingosine, lactosylceramide, and monogalactosyldiglyceride. Accordingly, utilities of VGAM915 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with GALC. The function of GALC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM624. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM\_017575) is another VGAM915 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19008, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34596] Another function of VGAM915 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM\_017575). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31.

FLJ11362 (Accession NM\_021946) is another VGAM915 host target gene. FLJ11362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by FLJ11362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11362 BINDING SITE, designated SEQ ID:22469, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34597] Another function of VGAM915 is therefore inhibition of FLJ11362 (Accession NM\_021946). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11362. KIAA0449 (Accession NM\_017596) is another VGAM915 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19055, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34598] Another function of VGAM915 is therefore inhibition of KIAA0449 (Accession NM\_017596). Accordingly, utilities

of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. SET Binding Protein 1 (SETBP1, Accession NM\_015559) is another VGAM915 host target gene. SETBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SETBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SETBP1 BINDING SITE, designated SEQ ID:17827, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34599] Another function of VGAM915 is therefore inhibition of SET Binding Protein 1 (SETBP1, Accession NM\_015559). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SETBP1. LOC149302 (Accession XM\_086489) is another VGAM915 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38703, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34600] Another function of VGAM915 is therefore inhibition of LOC149302 (Accession XM\_086489). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149302. LOC203378 (Accession XM\_117541) is another VGAM915 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43546, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34601] Another function of VGAM915 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC203378. LOC256267 (Accession XM\_173007) is another VGAM915 host target gene. LOC256267 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256267 BINDING SITE, designated SEQ ID:46277, to the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, also designated SEQ ID:3626.

[34602] Another function of VGAM915 is therefore inhibition of LOC256267 (Accession XM\_173007). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256267. LOC92466 (Accession XM\_045251) is another VGAM915 host target gene. LOC92466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:34396, to the nucleotide sequence of VGAM915 RNA, herein designated

VGAM RNA, also designated SEQ ID:3626.

[34603] Another function of VGAM915 is therefore inhibition of LOC92466 (Accession XM\_045251). Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 916 (VGAM916) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34604] VGAM916 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM916 was detected is described hereinabove with reference to Figs. 1–8.

[34605] VGAM916 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichoplusia Ni Cytoplasmic Polyhedrosis Virus 15. VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34606] VGAM916 gene encodes a VGAM916 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM916 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM916 precursor RNA is designated SEQ ID:902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:902 is located at position 762 relative to the genome of Tri-choplusia Ni Cytoplasmic Polyhedrosis Virus 15.

[34607] VGAM916 precursor RNA folds onto itself, forming VGAM916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34608] An enzyme complex designated DICER COMPLEX, `dices` the VGAM916 folded precursor RNA into VGAM916 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM916 RNA is designated SEQ ID:3627, and is provided hereinbelow with reference to the sequence listing part.

[34609] VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM916 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34610] VGAM916 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM916 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM916 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34611] The complementary binding of VGAM916 RNA, herein designated VGAM RNA, to host target binding sites on VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM916 host target RNA into VGAM916 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34612] It is appreciated that VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM916 host target genes. The mRNA of

each one of this plurality of VGAM916 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM916 RNA, herein designated VGAM RNA, and which when bound by VGAM916 RNA causes inhibition of translation of respective one or more VGAM916 host target proteins.

[34613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM916 gene, herein designated VGAM GENE, on one or more VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[34614] It is yet further appreciated that a function of VGAM916 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM916 include diagnosis, prevention and treatment of viral infection by Trichoplusia Ni Cytoplasmic Polyhedrosis Virus 15. Specific functions, and accordingly utilities, of VGAM916 correlate with, and may be deduced from, the identity of the host target genes which VGAM916 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34615] Nucleotide sequences of the VGAM916 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM916 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM916 are further described hereinbelow with reference to Table 1.

[34616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM916 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM916 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[34617] As mentioned hereinabove with reference to Fig. 1, a function of VGAM916 gene, herein designated VGAM is inhibition of expression of VGAM916 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM916 correlate with, and may be deduced from, the identity of the target genes which VGAM916 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34618] Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM\_004602) is a VGAM916 host target gene. STAU BINDING SITE1 through STAU BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE1 through STAU BINDING SITE4, designated SEQ ID:10938, SEQ ID:18911, SEQ ID:18917 and SEQ ID:18923 respectively, to the nucleotide sequence of VGAM916 RNA, herein designated VGAM RNA, also designated SEQ ID:3627.

[34619] A function of VGAM916 is therefore inhibition of Staufén, RNA Binding Protein (*Drosophila*) (STAU, Accession NM\_004602), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of VGAM916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU. The function of STAU has been established by previous studies. In *Drosophila*, genetic studies have identified a number of potential genes that are necessary for localization of mRNAs in oocytes, one of which is the staufén gene. The staufén gene product is a double-stranded RNA (dsRNA)-binding protein that contains several copies of a consensus dsRNA-binding domain (RBD). By searching an EST database for staufén-related sequences, Wickham et al. (1999) identified a partial cDNA encoding STAU, a human staufén homolog. Using RACE and library screening, they recovered additional cDNAs corresponding to the entire STAU coding region. Northern blot analysis indicated that the STAU gene was expressed as an unresolved band of approximately 3.6 kb in all tissues tested. Characterization of STAU cDNAs revealed that there are 4 different STAU transcripts encoding predicted 496- and 577-amino

acid isoforms differing in their N-terminal extremities. Wickham et al. (1999) also cloned a mouse Stau cDNA. Mouse and human STAU are 90% identical on the amino acid level. The RBDs are well conserved between *Drosophila* and mammalian stau proteins in terms of overall structure and relative positions, and share 47 to 66% identity. However, the mammalian proteins lack the first RBD found in *Drosophila* stau and contain a putative microtubule-binding domain not found in the *Drosophila* protein. In vitro, STAU bound dsRNA and tubulin, suggesting that it crosslinks cytoskeletal and RNA components. In mammalian cells expressing epitope-tagged STAU, immunofluorescence experiments revealed that STAU is localized to the rough endoplasmic reticulum. Wickham et al. (1999) proposed that STAU plays a role in the targeting of RNA to its site of translation. The influenza virus nonstructural protein NS1 is an RNA-binding protein that may be involved in regulatory processes during viral infection, including pre-mRNA splicing, retention of poly(A)-containing RNA in the nucleus, and the stimulation of viral mRNA translation. Using a yeast 2-hybrid screen, Marion et al. (1999) identified stau-like as a protein that bound NS1. By immunofluo-

rescence, they localized endogenous staufen-like to the rough endoplasmic reticulum in HeLa cells. Sedimentation analyses indicated that staufen-like associates with polysomes in these cells. Marion et al. (1999) suggested that staufen-like might therefore play a dual role: positioning specific mRNAs at given sites in the cell, and stimulating their translation at the site.

[34620] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34621] Marion, R. M.; Fortes, P.; Beloso, A.; Dotti, C.; Ortin, J. : A human sequence homologue of staufen is an RNA-binding protein that is associated with polysomes and localizes to the rough endoplasmic reticulum. *Molec. Cell. Biol.* 19: 2212-2219, 1999. ; and

[34622] Wickham, L.; Duchaine, T.; Luo, M.; Nabi, I. R.; DesGroseillers, L. : Mammalian staufen is a double-stranded-RNA- and tubulin-binding protein which localizes to the rough endoplasmic r.

[34623] Further studies establishing the function and utilities of STAU are found in John Hopkins OMIM database record ID 601716, and in cited publications numbered 9115-9117 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference.FLJ13187 (Accession NM\_024613) is another VGAM916 host target gene. FLJ13187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13187 BINDING SITE, designated SEQ ID:23868, to the nucleotide sequence of VGAM916 RNA, herein designated VGAM RNA, also designated SEQ ID:3627.

[34624] Another function of VGAM916 is therefore inhibition of FLJ13187 (Accession NM\_024613). Accordingly, utilities of VGAM916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13187. Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM\_139168) is another VGAM916 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ

ID:29173, to the nucleotide sequence of VGAM916 RNA, herein designated VGAM RNA, also designated SEQ ID:3627.

[34625] Another function of VGAM916 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM\_139168). Accordingly, utilities of VGAM916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 917 (VGAM917) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34626] VGAM917 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM917 was detected is described hereinabove with reference to Figs. 1–8.

[34627] VGAM917 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34628] VGAM917 gene encodes a VGAM917 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM917 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM917 precursor RNA is designated SEQ ID:903, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:903 is located at position 134932 relative to the genome of Vaccinia Virus.

[34629] VGAM917 precursor RNA folds onto itself, forming VGAM917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34630] An enzyme complex designated DICER COMPLEX, `dices` the VGAM917 folded precursor RNA into VGAM917 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM917 RNA is designated SEQ ID:3628, and is provided hereinbelow with reference to the sequence listing part.

[34631] VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM917 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34632] VGAM917 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM917 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM917 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34633] The complementary binding of VGAM917 RNA, herein designated VGAM RNA, to host target binding sites on VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM917 host target RNA into VGAM917 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34634] It is appreciated that VGAM917 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM917 host target genes. The mRNA of each one of this plurality of VGAM917 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM917 RNA, herein designated VGAM RNA, and which when bound by VGAM917 RNA causes inhibition of translation of respective one or more VGAM917 host target proteins.

[34635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM917 gene, herein designated VGAM GENE, on one or more VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[34636] It is yet further appreciated that a function of VGAM917 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM917 correlate with, and may be deduced from, the identity of the host target genes which VGAM917 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34637] Nucleotide sequences of the VGAM917 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM917 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM917 are further described hereinbelow with reference to Table 1.

[34638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM917 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM917 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34639] As mentioned hereinabove with reference to Fig. 1, a function of VGAM917 gene, herein designated VGAM is inhibition of expression of VGAM917 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM917 correlate with, and may be deduced from, the identity of the target genes which VGAM917 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34640] ATPase, Class V, Type 10B (ATP10B, Accession XM\_032721) is a VGAM917 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING SITE, designated SEQ ID:31735, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34641] A function of VGAM917 is therefore inhibition of ATPase,

Class V, Type 10B (ATP10B, Accession XM\_032721). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. BDG-29 (Accession XM\_051343) is another VGAM917 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35815, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34642] Another function of VGAM917 is therefore inhibition of BDG-29 (Accession XM\_051343). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. GW112 (Accession NM\_006418) is another VGAM917 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13131, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34643] Another function of VGAM917 is therefore inhibition of GW112 (Accession NM\_006418). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424) is another VGAM917 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15780, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34644] Another function of VGAM917 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424). Accordingly, utilities of VGAM917 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with HSPB7. KIAA1464 (Accession XM\_043069) is another VGAM917 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33882, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34645] Another function of VGAM917 is therefore inhibition of KIAA1464 (Accession XM\_043069). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1634 (Accession XM\_032749) is another VGAM917 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31752, to the

nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34646] Another function of VGAM917 is therefore inhibition of KIAA1634 (Accession XM\_032749). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM\_138999) is another VGAM917 host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:29097, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34647] Another function of VGAM917 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM\_138999). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. PRO2533 (Accession NM\_018629) is another VGAM917 host target

gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20703, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34648] Another function of VGAM917 is therefore inhibition of PRO2533 (Accession NM\_018629). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM\_098021) is another VGAM917 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41324, to the nucleotide sequence of VGAM917 RNA, herein designated VGAM RNA, also designated SEQ ID:3628.

[34649] Another function of VGAM917 is therefore inhibition of LOC151201 (Accession XM\_098021). Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 918 (VGAM918) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34650] VGAM918 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM918 was detected is described hereinabove with reference to Figs. 1–8.

[34651] VGAM918 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34652] VGAM918 gene encodes a VGAM918 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM918

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM918 precursor RNA is designated SEQ ID:904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:904 is located at position 642 relative to the genome of Vaccinia Virus.

[34653] VGAM918 precursor RNA folds onto itself, forming VGAM918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34654] An enzyme complex designated DICER COMPLEX, `dices` the VGAM918 folded precursor RNA into VGAM918 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 76%) nucleotide sequence of VGAM918 RNA is designated SEQ ID:3629, and is provided hereinbelow with reference to the sequence listing part.

[34655] VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM918 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[34656] VGAM918 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM918 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM918 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34657] The complementary binding of VGAM918 RNA, herein designated VGAM RNA, to host target binding sites on VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM918 host target RNA into VGAM918 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34658] It is appreciated that VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM918 host target genes. The mRNA of each one of this plurality of VGAM918 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM918 RNA, herein designated VGAM RNA, and which when bound by VGAM918 RNA causes inhibition of translation of respective one or more VGAM918 host target proteins.

[34659] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM918 gene, herein designated VGAM GENE, on one or more VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34660] It is yet further appreciated that a function of VGAM918 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM918 correlate with, and may be deduced from, the identity of the host target genes which VGAM918 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34661] Nucleotide sequences of the VGAM918 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM918 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM918 are further described hereinbelow with reference to Table 1.

[34662] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM918 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM918 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34663] As mentioned hereinabove with reference to Fig. 1, a function of VGAM918 gene, herein designated VGAM is inhibition of expression of VGAM918 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM918 correlate with, and may be deduced from, the identity of the target genes which VGAM918 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34664] Myosin IE (MYO1E, Accession NM\_004998) is a VGAM918 host target gene. MYO1E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1E BINDING SITE, designated SEQ ID:11441, to the nucleotide sequence of

VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34665] A function of VGAM918 is therefore inhibition of Myosin IE (MYO1E, Accession NM\_004998), a gene which is an unconventional myosin. Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1E. The function of MYO1E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM\_038377) is another VGAM918 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:32836, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34666] Another function of VGAM918 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2

(ROCK2, Accession XM\_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273.MGC15937 (Accession NM\_080661) is another VGAM918 host target gene. MGC15937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:27949, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34667] Another function of VGAM918 is therefore inhibition of MGC15937 (Accession NM\_080661). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC15937. LOC148029 (Accession XM\_086014) is another VGAM918 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:38447, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34668] Another function of VGAM918 is therefore inhibition of LOC148029 (Accession XM\_086014). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC169436 (Accession XM\_095696) is another VGAM918 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:40279, to the nucleotide sequence of VGAM918 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3629.

[34669] Another function of VGAM918 is therefore inhibition of LOC169436 (Accession XM\_095696). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169436. LOC256267 (Accession XM\_173007) is another VGAM918 host target gene. LOC256267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256267 BINDING SITE, designated SEQ ID:46276, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34670] Another function of VGAM918 is therefore inhibition of LOC256267 (Accession XM\_173007). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256267. LOC257426 (Accession XM\_039451) is another VGAM918 host target gene. LOC257426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257426, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257426 BINDING SITE, designated SEQ ID:33098, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34671] Another function of VGAM918 is therefore inhibition of LOC257426 (Accession XM\_039451). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257426. LOC92466 (Accession XM\_045251) is another VGAM918 host target gene. LOC92466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:34395, to the nucleotide sequence of VGAM918 RNA, herein designated VGAM RNA, also designated SEQ ID:3629.

[34672] Another function of VGAM918 is therefore inhibition of LOC92466 (Accession XM\_045251). Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 919 (VGAM919) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34673] VGAM919 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM919 was detected is described hereinabove with reference to Figs. 1–8.

[34674] VGAM919 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34675] VGAM919 gene encodes a VGAM919 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM919 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM919 precursor RNA is designated SEQ

ID:905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:905 is located at position 963 relative to the genome of Vaccinia Virus.

[34676] VGAM919 precursor RNA folds onto itself, forming VGAM919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34677] An enzyme complex designated DICER COMPLEX, `dices` the VGAM919 folded precursor RNA into VGAM919 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM919 RNA is designated SEQ ID:3630, and is provided hereinbelow with reference to the sequence

listing part.

[34678] VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM919 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34679] VGAM919 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM919 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM919 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34680] The complementary binding of VGAM919 RNA, herein designated VGAM RNA, to host target binding sites on VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM919 host target RNA into VGAM919 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34681] It is appreciated that VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM919 host target genes. The mRNA of each one of this plurality of VGAM919 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM919 RNA, herein designated VGAM

RNA, and which when bound by VGAM919 RNA causes inhibition of translation of respective one or more VGAM919 host target proteins.

[34682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM919 gene, herein designated VGAM GENE, on one or more VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34683] It is yet further appreciated that a function of VGAM919 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM919 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM919 correlate with, and may be deduced from, the identity of the host target genes which VGAM919 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34684] Nucleotide sequences of the VGAM919 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM919 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM919 are further described hereinbelow with reference to Table 1.

[34685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM919 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM919 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34686] As mentioned hereinabove with reference to Fig. 1, a function of VGAM919 gene, herein designated VGAM is

inhibition of expression of VGAM919 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM919 correlate with, and may be deduced from, the identity of the target genes which VGAM919 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34687] LOC152078 (Accession XM\_087376) is a VGAM919 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39213, to the nucleotide sequence of VGAM919 RNA, herein designated VGAM RNA, also designated SEQ ID:3630.

[34688] A function of VGAM919 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 920 (VGAM920) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34689] VGAM920 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM920 was detected is described hereinabove with reference to Figs. 1–8.

[34690] VGAM920 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34691] VGAM920 gene encodes a VGAM920 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM920 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM920 precursor RNA is designated SEQ ID:906, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:906 is located at position 1243 relative to the genome of Vaccinia Virus.

[34692] VGAM920 precursor RNA folds onto itself, forming VGAM920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34693] An enzyme complex designated DICER COMPLEX, `dices` the VGAM920 folded precursor RNA into VGAM920 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM920 RNA is designated SEQ ID:3631, and is provided hereinbelow with reference to the sequence listing part.

[34694] VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM920 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM920 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34695] VGAM920 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM920 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM920 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34696] The complementary binding of VGAM920 RNA, herein designated VGAM RNA, to host target binding sites on VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM920 host target RNA into VGAM920 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34697] It is appreciated that VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM920 host target genes. The mRNA of each one of this plurality of VGAM920 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM920 RNA, herein designated VGAM RNA, and which when bound by VGAM920 RNA causes inhibition of translation of respective one or more VGAM920 host target proteins.

[34698] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM920 gene, herein designated VGAM GENE, on one or more VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34699] It is yet further appreciated that a function of VGAM920 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM920 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM920 correlate with, and may be deduced from, the identity of the host

target genes which VGAM920 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34700] Nucleotide sequences of the VGAM920 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM920 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM920 are further described hereinbelow with reference to Table 1.

[34701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM920 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM920 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34702] As mentioned hereinabove with reference to Fig. 1, a function of VGAM920 gene, herein designated VGAM is inhibition of expression of VGAM920 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM920 correlate with, and may be deduced from, the identity of the target genes which VGAM920

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34703] LOC152078 (Accession XM\_087376) is a VGAM920 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39213, to the nucleotide sequence of VGAM920 RNA, herein designated VGAM RNA, also designated SEQ ID:3631.

[34704] A function of VGAM920 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 921 (VGAM921) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34705] VGAM921 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM921 was detected is described hereinabove with reference to Figs. 1–8.

[34706] VGAM921 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Clump Virus. VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34707] VGAM921 gene encodes a VGAM921 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM921 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM921 precursor RNA is designated SEQ ID:907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:907 is located at position 3787 relative to the genome of Peanut Clump Virus.

[34708] VGAM921 precursor RNA folds onto itself, forming VGAM921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[34709] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM921 folded precursor RNA into VGAM921 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM921 RNA is designated SEQ ID:3632, and is provided hereinbelow with reference to the sequence listing part.

[34710] VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM921 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[34711] VGAM921 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM921 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM921 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34712] The complementary binding of VGAM921 RNA, herein designated VGAM RNA, to host target binding sites on VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM921 host target RNA into VGAM921 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34713] It is appreciated that VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM921 host target genes. The mRNA of each one of this plurality of VGAM921 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM921 RNA, herein designated VGAM RNA, and which when bound by VGAM921 RNA causes inhibition of translation of respective one or more VGAM921 host target proteins.

[34714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM921 gene, herein designated VGAM GENE, on one or more VGAM921 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34715] It is yet further appreciated that a function of VGAM921 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of viral infection by Peanut Clump Virus. Specific functions, and accordingly utilities, of VGAM921 correlate with, and may be deduced from, the identity of the host target genes which VGAM921 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34716] Nucleotide sequences of the VGAM921 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM921 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM921 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM921 are further  
described hereinbelow with reference to Table 1.

[34717] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM921 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM921 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[34718] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM921 gene, herein designated VGAM is  
inhibition of expression of VGAM921 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM921 correlate with, and may be deduced  
from, the identity of the target genes which VGAM921  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[34719] Adenylosuccinate Synthase (ADSS, Accession XM\_049992)  
is a VGAM921 host target gene. ADSS BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADSS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADSS BINDING SITE, designated SEQ ID:35541, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34720] A function of VGAM921 is therefore inhibition of Adenylosuccinate Synthase (ADSS, Accession XM\_049992), a gene which plays an important role in the de novo pathway of purine nucleotide biosynthesis. Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADSS. The function of ADSS has been established by previous studies. Somatic cell hybrids between human cells and Chinese hamster ovary cells deficient in specific steps in the purine biosynthetic pathway permitted mapping of human genes correcting the defects. The ade(-)H mutant is missing the enzyme adenylosuccinate synthetase (IMP:L-aspartate ligase; EC 6.3.4.4.), which carries out the first of a 2-step sequence in the biosynthesis of AMP from IMP. Thus, ade(-)H cells require exogenous adenine for growth. Lai et

al. (1989) found that in somatic cell hybrids human chromosome 1 corrected the defect so that the hybrid cell containing chromosome 1 grew without adenine. Lai et al. (1991) reported that analysis of a human/CHO translocation chromosome that arose in 1 of the hybrids suggested that the gene correcting the defect lies in the region 1cen-q12. (See their Figure 1 for a useful diagram of the purine biosynthesis pathway and the purine nucleotide cycle pathway, together with the location of the genes for the enzymes when known.) AMP deaminase, which converts AMP back to IMP, is coded by a gene, perhaps 2 genes, in region 1p21-p13; see 102770. From a human liver library, Powell et al. (1992) isolated a cDNA that encoded a protein of 455 amino acids. Alignment with the sequence of the ADSS gene in mouse, *Dictyostelium discoideum*, and *E. coli* pointed to invariant residues that are likely to be important for structure and/or catalysis. The human ADSS sequence also showed some similarity to argininosuccinate synthetase, which catalyzes a chemically similar reaction.

[34721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [34722] Lai, L.-W.; Hart, I. M.; Patterson, D. : A gene correcting the defect in the CHO mutant Ade(-)H, deficient in a branch point enzyme (adenylosuccinate synthetase) of de novo purine biosynthesis, is located on the long arm of chromosome 1. *Genomics* 9: 322-328, 1991. ; and
- [34723] Powell, S. M.; Zalkin, H.; Dixon, J. E. : Cloning and characterization of the cDNA encoding human adenylosuccinate synthetase. *FEBS Lett.* 303: 4-10, 1992.
- [34724] Further studies establishing the function and utilities of ADSS are found in John Hopkins OMIM database record ID 103060, and in cited publications numbered 489-491 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domain Only 7 (LMO7, Accession NM\_015843) is another VGAM921 host target gene. LMO7 BINDING SITE1 and LMO7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LMO7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE1 and LMO7 BINDING SITE2, designated SEQ ID:17971 and SEQ ID:11828 respectively, to the nucleotide sequence of VGAM921 RNA, herein designated

VGAM RNA, also designated SEQ ID:3632.

[34725] Another function of VGAM921 is therefore inhibition of LIM Domain Only 7 (LMO7, Accession NM\_015843). Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7. RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM\_003800) is another VGAM921 host target gene. RNGTT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNGTT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNGTT BINDING SITE, designated SEQ ID:9895, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34726] Another function of VGAM921 is therefore inhibition of RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM\_003800), a gene which is an mRNA capping enzyme; bifunctional enzyme containing both 5'-triphosphatase and mRNA guanylyltransferase activity. Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RNGTT. The function of RNGTT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.FLJ14906 (Accession NM\_032859) is another VGAM921 host target gene.

FLJ14906 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14906 BINDING SITE, designated SEQ ID:26662, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34727] Another function of VGAM921 is therefore inhibition of FLJ14906 (Accession NM\_032859). Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14906. KIAA1727 (Accession XM\_034262) is another VGAM921 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32036, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34728] Another function of VGAM921 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1854 (Accession XM\_049884) is another VGAM921 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35524, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34729] Another function of VGAM921 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1854. LOC153114 (Accession XM\_098313) is another VGAM921 host target gene. LOC153114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153114 BINDING SITE, designated SEQ ID:41573, to the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, also designated SEQ ID:3632.

[34730] Another function of VGAM921 is therefore inhibition of LOC153114 (Accession XM\_098313). Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153114. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 922 (VGAM922) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34731] VGAM922 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM922 was detected is described hereinabove with reference to Figs. 1–8.

[34732] VGAM922 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Clump Virus.

VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34733] VGAM922 gene encodes a VGAM922 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM922 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM922 precursor RNA is designated SEQ ID:908, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:908 is located at position 1130 relative to the genome of Peanut Clump Virus.

[34734] VGAM922 precursor RNA folds onto itself, forming VGAM922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34735] An enzyme complex designated DICER COMPLEX, `dices` the VGAM922 folded precursor RNA into VGAM922 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM922 RNA is designated SEQ ID:3633, and is provided hereinbelow with reference to the sequence listing part.

[34736] VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM922 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34737] VGAM922 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM922 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM922 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[34738] The complementary binding of VGAM922 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM922 host target RNA into VGAM922 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34739] It is appreciated that VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM922 host target genes. The mRNA of each one of this plurality of VGAM922 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM922 RNA, herein designated VGAM RNA, and which when bound by VGAM922 RNA causes inhibition of translation of respective one or more VGAM922 host target proteins.

[34740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM922 gene, herein designated VGAM GENE, on one or more VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34741] It is yet further appreciated that a function of VGAM922 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of viral infection by Peanut Clump Virus. Specific functions, and accordingly utilities, of VGAM922 correlate with, and may be deduced from, the identity of the host target genes which VGAM922 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34742] Nucleotide sequences of the VGAM922 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM922 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM922 are further described hereinbelow with reference to Table 1.

[34743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM922 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM922 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34744] As mentioned hereinabove with reference to Fig. 1, a function of VGAM922 gene, herein designated VGAM is inhibition of expression of VGAM922 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM922 correlate with, and may be deduced from, the identity of the target genes which VGAM922 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34745] Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM\_024408) is a VGAM922 host target gene. NOTCH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOTCH2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOTCH2 BINDING SITE, designated SEQ ID:23651, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34746] A function of VGAM922 is therefore inhibition of Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM\_024408), a gene which is moderately similar to a region of murine Notch1 and contains an ankyrin repeat. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH2. The function of NOTCH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93. Polymerase (DNA directed), Theta (POLQ, Accession NM\_006596) is another VGAM922 host target gene. POLQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of POLQ BINDING SITE, designated SEQ ID:13368, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34747] Another function of VGAM922 is therefore inhibition of Polymerase (DNA directed), Theta (POLQ, Accession NM\_006596), a gene which enhances untargeted mutagenesis. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLQ. The function of POLQ has been established by previous studies. By EST database searching for homologs of yeast Rad30 and screening of a fetal brain cDNA library, Johnson et al. (2000) also cloned POLK, which they termed POL-theta (POLQ) because it encodes the eighth known eukaryotic polymerase. Functional analysis showed that purified POLK can incorporate all 4 nucleotides almost to the end of the template. In contrast to POLH, POLK, which lacks a proofreading exonuclease function, is unable to bypass DNA lesions, namely cis-syn T-T dimers, T-T photoproducts, or an abasic site. Assays of fidelity of replication indicated that POLK misincorporated deoxynucleotides with a frequency of 1/1000 to 1/10,000, a rate 10-fold lower than that of POLH. Ohashi

et al. (2000) also found that POLK is unable to bypass T-T dimers. Unlike Johnson et al. (2000), however, they did observe bypassing of abasic sites, the most common lesions in DNA within cells which are generated by spontaneous hydrolysis of the N glycoside bond during the course of repairing base-damage generated by carcinogenic agents and ionizing radiation. Ohashi et al. (2000) noted that their finding was heavily dependent on sequence context and enzyme concentration.

[34748] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34749] Johnson, R. E.; Prakash, S.; Prakash, L. : The human DINB1 gene encodes the DNA polymerase Pol-theta. Proc. Nat. Acad. Sci. 97: 3838-3843, 2000. ; and

[34750] Ohashi, E.; Ogi, T.; Kusumoto, R.; Iwai, S.; Masutani, C.; Hanaoka, F.; Ohmori, H. : Error-prone bypass of certain DNA lesions by the human DNA polymerase kappa. Genes Dev. 14: 1589-1594.

[34751] Further studies establishing the function and utilities of POLQ are found in John Hopkins OMIM database record ID 605650, and in cited publications numbered 411-414 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. RAD1 Homolog (*S. pombe*) (RAD1, Accession NM\_133282) is another VGAM922 host target gene. RAD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD1 BINDING SITE, designated SEQ ID:28436, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34752] Another function of VGAM922 is therefore inhibition of RAD1 Homolog (*S. pombe*) (RAD1, Accession NM\_133282), a gene which has important roles in DNA damage-activated mitotic and meiotic cell cycle checkpoints. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD1. The function of RAD1 has been established by previous studies. In the fission yeast *S. pombe*, the *rad1+* gene product is required for DNA repair and replication. Parker et al. (1998) cloned 2 alternatively spliced human cDNAs encoding proteins with significant homology to yeast *rad1+*. The longer cDNA, called

Hrad1A, encodes a 282–amino acid polypeptide, while Hrad1B encodes a 163–amino acid polypeptide. Northern blot analysis revealed that human RAD1 is expressed as mRNAs of 5, 3, and 1.3 kb in a variety of human tissues, with higher levels present in some cancer cell lines.

Northern blot analysis of cells subjected to ultraviolet radiation demonstrated that human RAD1 expression is not induced in response to DNA damage. Purified RAD1 exhibited terminal exonuclease activity on double–stranded DNA, with a preference for 3–prime ends. Independently, Udell et al. (1998) isolated RAD1 cDNAs from a spontaneously transformed human keratinocyte cDNA library. The cDNAs encode the 282–amino acid RAD1 isoform, which is 90% and 27% identical to mouse Rad1 and *S. pombe rad1+*, respectively. Udell et al. (1998) found that expression of human RAD1 in yeast *rad1* mutants partially restores radiation resistance and G2 checkpoint proficiency.

[34753] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34754] Parker, A. E.; Van de Weyer, I.; Laus, M. C.; Oostveen, I.; Yon, J.; Verhasselt, P.; Luyten, W. H. M. L. : A human ho–

mologue of *Schizosaccharomyces pombe* rad1+ checkpoint gene encodes an exonuclease. J. Biol. Chem. 273: 18332–18339, 1998. ; and

[34755] Udell, C. M.; Lee, S. K.; Davey, S. : HRAD1 and MRAD1 encode mammalian homologues of the fission yeast rad1+ cell cycle checkpoint control gene. Nucleic Acids Res. 26: 3971–3976, 1998.

[34756] Further studies establishing the function and utilities of RAD1 are found in John Hopkins OMIM database record ID 603153, and in cited publications numbered 690, 543 and 2422 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.

RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM922 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9890, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34757] Another function of VGAM922 is therefore inhibition of

RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.SIP (Accession NM\_014412) is another VGAM922 host target gene. SIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIP BINDING SITE, designated SEQ ID:15759, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34758] Another function of VGAM922 is therefore inhibition of SIP (Accession NM\_014412). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIP. Solute Carrier Family 38, Member 3 (SLC38A3, Accession

NM\_006841) is another VGAM922 host target gene. SLC38A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC38A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A3 BINDING SITE, designated SEQ ID:13714, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34759] Another function of VGAM922 is therefore inhibition of Solute Carrier Family 38, Member 3 (SLC38A3, Accession NM\_006841), a gene which involves H<sup>+</sup> exchange and Na<sup>+</sup> cotransport, mediates glutamine efflux and uptake. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A3. The function of SLC38A3 has been established by previous studies. The amino acid glutamine has a central role in nitrogen metabolism. Although the molecular mechanisms responsible for its transport across cell membranes are poorly understood, classical amino acid transport system N appears particularly important. Using intracellular pH measurements,

Chaudhry et al. (1999) identified an orphan protein, which they called SN1, related to the vesicular GABA transporter (VGAT) as system N. Functional analysis by Chaudhry et al. (1999) showed that this protein involves H<sup>+</sup> exchange as well as Na<sup>+</sup> cotransport and, under physiologic conditions, mediates glutamine efflux as well as uptake. Together with the pattern of SN1 expression, these unusual properties suggested novel physiologic roles for system N in nitrogen metabolism and synaptic transmission

[34760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34761] Chaudhry, F. A.; Reimer, R. J.; Krizaj, D.; Barber, D.; Storm-Mathisen, J.; Copenhagen, D. R.; Edwards, R. H. : Molecular analysis of system N suggests novel physiological roles in nitrogen metabolism and synaptic transmission. Cell 99: 769–780, 1999. ; and

[34762] Lerman, M. I.; Minna, J. D. : The 630-kb lung cancer homozygous deletion region on human chromosome 3p21.3: identification and evaluation of the resident candidate tumor suppressor genes.

[34763] Further studies establishing the function and utilities of SLC38A3 are found in John Hopkins OMIM database

record ID 604437, and in cited publications numbered 7939 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185) is another VGAM922 host target gene.

ARHGEF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17544, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34764] Another function of VGAM922 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM\_015185). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. CG018 (Accession NM\_052818) is another VGAM922 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CG018, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27401, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34765] Another function of VGAM922 is therefore inhibition of CG018 (Accession NM\_052818). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018. DKFZP434J214 (Accession XM\_027639) is another VGAM922 host target gene. DKFZP434J214 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J214 BINDING SITE, designated SEQ ID:30550, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34766] Another function of VGAM922 is therefore inhibition of DKFZP434J214 (Accession XM\_027639). Accordingly, utilities of VGAM922 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DKFZP434J214. HCA127 (Accession NM\_018684) is another VGAM922 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20760, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34767] Another function of VGAM922 is therefore inhibition of HCA127 (Accession NM\_018684). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. KIAA0931 (Accession XM\_041191) is another VGAM922 host target gene. KIAA0931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33488, to the nucleotide sequence of

VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34768] Another function of VGAM922 is therefore inhibition of KIAA0931 (Accession XM\_041191). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. KIAA1795 (Accession XM\_050988) is another VGAM922 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35702, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34769] Another function of VGAM922 is therefore inhibition of KIAA1795 (Accession XM\_050988). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. MGC5457 (Accession NM\_032633) is another VGAM922 host target gene. MGC5457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC5457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5457 BINDING SITE, designated SEQ ID:26348, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34770] Another function of VGAM922 is therefore inhibition of MGC5457 (Accession NM\_032633). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5457. NYD-SP27 (Accession NM\_033123) is another VGAM922 host target gene. NYD-SP27 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NYD-SP27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP27 BINDING SITE, designated SEQ ID:26969, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34771] Another function of VGAM922 is therefore inhibition of NYD-SP27 (Accession NM\_033123). Accordingly, utilities

of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP27. PRO0132 (Accession NM\_014116) is another VGAM922 host target gene. PRO0132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0132 BINDING SITE, designated SEQ ID:15369, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34772] Another function of VGAM922 is therefore inhibition of PRO0132 (Accession NM\_014116). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0132. SHAPY (Accession NM\_138793) is another VGAM922 host target gene. SHAPY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHAPY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHAPY BINDING SITE, designated SEQ

ID:29016, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34773] Another function of VGAM922 is therefore inhibition of SHAPY (Accession NM\_138793). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHAPY. UCK1 (Accession NM\_031432) is another VGAM922 host target gene. UCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCK1 BINDING SITE, designated SEQ ID:25428, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34774] Another function of VGAM922 is therefore inhibition of UCK1 (Accession NM\_031432). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCK1. WD Repeat Domain 9 (WDR9, Accession NM\_018963) is another VGAM922 host target gene. WDR9 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR9 BINDING SITE, designated SEQ ID:21034, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34775] Another function of VGAM922 is therefore inhibition of WD Repeat Domain 9 (WDR9, Accession NM\_018963). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR9. LOC143465 (Accession XM\_096430) is another VGAM922 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40367, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34776] Another function of VGAM922 is therefore inhibition of

LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC159963 (Accession XM\_089960) is another VGAM922 host target gene. LOC159963 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159963 BINDING SITE, designated SEQ ID:39988, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34777] Another function of VGAM922 is therefore inhibition of LOC159963 (Accession XM\_089960). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159963. LOC200609 (Accession XM\_117256) is another VGAM922 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43340, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34778] Another function of VGAM922 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC222237 (Accession XM\_168592) is another VGAM922 host target gene. LOC222237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:45270, to the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, also designated SEQ ID:3633.

[34779] Another function of VGAM922 is therefore inhibition of LOC222237 (Accession XM\_168592). Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 923 (VGAM923) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34780] VGAM923 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM923 was detected is described hereinabove with reference to Figs. 1–8.

[34781] VGAM923 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Clump Virus. VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34782] VGAM923 gene encodes a VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM923 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM923 precursor RNA is designated SEQ ID:909, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:909 is

located at position 1684 relative to the genome of Peanut Clump Virus.

[34783] VGAM923 precursor RNA folds onto itself, forming VGAM923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34784] An enzyme complex designated DICER COMPLEX, `dices` the VGAM923 folded precursor RNA into VGAM923 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM923 RNA is designated SEQ ID:3634, and is provided hereinbelow with reference to the sequence listing part.

[34785] VGAM923 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM923 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[34786] VGAM923 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM923 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM923 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM923 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34787] The complementary binding of VGAM923 RNA, herein designated VGAM RNA, to host target binding sites on VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM923 host target RNA into VGAM923 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34788] It is appreciated that VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM923 host target genes. The mRNA of each one of this plurality of VGAM923 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM923 RNA, herein designated VGAM RNA, and which when bound by VGAM923 RNA causes inhibition of translation of respective one or more VGAM923

host target proteins.

[34789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM923 gene, herein designated VGAM GENE, on one or more VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34790] It is yet further appreciated that a function of VGAM923 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of viral infection by Peanut Clump Virus. Spe-

cific functions, and accordingly utilities, of VGAM923 correlate with, and may be deduced from, the identity of the host target genes which VGAM923 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34791] Nucleotide sequences of the VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM923 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM923 are further described hereinbelow with reference to Table 1.

[34792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM923 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM923 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34793] As mentioned hereinabove with reference to Fig. 1, a function of VGAM923 gene, herein designated VGAM is inhibition of expression of VGAM923 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM923 correlate with, and may be deduced from, the identity of the target genes which VGAM923 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34794] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM\_005099) is a VGAM923 host target gene. ADAMTS4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE, designated SEQ ID:11565, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34795] A function of VGAM923 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM\_005099), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with ADAMTS4. The function of ADAMTS4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM809. Adenylate Cyclase 6 (ADCY6, Accession NM\_015270) is another VGAM923 host target gene. ADCY6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:17584, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34796] Another function of VGAM923 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM\_015270), a gene which is a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM22. Apoptotic Protease Activating Factor (APAF1, Accession NM\_013229) is another VGAM923 host target gene. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:14866 and SEQ ID:6827 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34797] Another function of VGAM923 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM\_013229), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Coronin, Actin Binding Protein, 2B (CORO2B,

Accession XM\_035403) is another VGAM923 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32252, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34798] Another function of VGAM923 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM\_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B. The function of CORO2B has been established by previous studies. The Dictyostelium actin-binding protein coronin accumulates at the leading edges of motile cells and in crown-shaped extensions on the dorsal cell surface. Coronin is involved in cell motility, cytokinesis, and phagocytosis, all of which depend on cytoskeletal rearrangement; see CORO1A (OMIM Ref. No. 605000). By

screening a frontal cortex cDNA library with a brain-enriched clone showing similarity to Dictyostelium coronin, Nakamura et al. (1999) isolated a full-length cDNA encoding CORO2B, which they called CLIPINC. The predicted 475-amino acid CORO2B protein has an N-terminal domain containing 5 WD repeats and a succeeding domain with a tendency to form alpha helices. Northern blot analysis detected abundant expression of an approximately 4.0-kb CORO2B transcript in brain, with moderate expression in heart and ovary, and little or no expression in other tissues tested. In contrast, CORO1A is primarily expressed in immune system tissues, and CORO2A (OMIM Ref. No. 602159) is predominantly expressed in colon, prostate, and testis. Immunohistochemical analysis revealed Coro2a expression in mouse cerebral cortex, hippocampus, thalamus, olfactory bulb, and cerebellum, as well as in the inner nuclear layer of embryonic retina and embryonic olfactory bulb. Cosedimentation analysis demonstrated that CORO2B associates with F-actin. Immunofluorescence analysis indicated that CORO2B accumulates at neurite tips, at focal adhesions in association with VCL (OMIM Ref. No. 193065), and along stress fibers.

[34799] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [34800] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XIII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 6: 63–70, 1999. ; and
- [34801] Nakamura, T.; Takeuchi, K.; Muraoka, S.; Takezoe, H.; Takahashi, N.; Mori, N. : A neurally enriched coronin-like protein, ClipnC, is a novel candidate for an actin cytoskeleton-cortical.
- [34802] Further studies establishing the function and utilities of CORO2B are found in John Hopkins OMIM database record ID 605002, and in cited publications numbered 8593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily VIIIB (sterol 12- $\alpha$ -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM\_004391) is another VGAM923 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10619, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34803] Another function of VGAM923 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- $\alpha$ -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM\_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 has been established by previous studies. Zhang and Chiang (2001) showed that hepatocyte nuclear factor-4- $\alpha$  (HNF4A; 600281) strongly activates CYP8B1 promoter activity, whereas CYP7A promoter-binding factor (CPF, or NR5A2; 604453) has much less effect. The promoter activities were strongly repressed by bile acid. EMSA and site-directed mutagenesis analysis indicated that HNF4A, CPF, and the bile acid response element have overlapping binding sites in CYP8B1. Mammalian 2-hybrid analysis demonstrated interaction of HNF4A with the small heterodimer partner (SHP; 604630). Functional analysis

determined that SHP represses HNF4A-induced CYP8B1 transcription. Zhang and Chiang (2001) concluded that bile acids repress human CYP8B1 transcription by reducing the transactivation activity of HNF4A through the interaction of HNF4A with SHP and a reduction of HNF4A expression in liver. Gafvels et al. (1999) obtained cDNAs encoding human and mouse CYP8B1. The deduced 501-amino acid human CYP8B1 protein is approximately 75% identical to the mouse and rabbit proteins. It contains a hydrophobic, membrane-spanning N terminus and conserved oxygen-binding, steroidogenic, and heme-binding segments. Northern blot analysis revealed expression of a 3.9-kb CYP8B1 transcript in liver. In mouse, expression was restricted to liver.

[34804] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34805] Gafvels, M.; Olin, M.; Chowdhary, B. P.; Raudsepp, T.; Andersson, U.; Persson, B.; Jansson, M.; Bjorkhem, I.; Eggertsen, G. : Structure and chromosomal assignment of the sterol 12- $\alpha$ -hydroxylase gene (CYP8B1) in human and mouse: eukaryotic cytochrome P-450 gene devoid of introns. *Genomics* 56: 184-196, 1999. ; and

- [34806] Zhang, M.; Chiang, J. Y. L. : Transcriptional regulation of the human sterol 12- $\alpha$ -hydroxylase gene (CYP8B1): roles of hepatocyte nuclear factor 4- $\alpha$  in mediating bile acid repre.
- [34807] Further studies establishing the function and utilities of CYP8B1 are found in John Hopkins OMIM database record ID 602172, and in cited publications numbered 5994-5996 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fc Fragment of IgA, Receptor For (FCAR, Accession NM\_133279) is another VGAM923 host target gene. FCAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCAR BINDING SITE, designated SEQ ID:28432, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.
- [34808] Another function of VGAM923 is therefore inhibition of Fc Fragment of IgA, Receptor For (FCAR, Accession NM\_133279), a gene which binds to the fc region of immunoglobulins alpha and mediates several functions in-

cluding cytokine production. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCAR. The function of FCAR has been established by previous studies. Human Fc-alpha receptor (FCAR) is present on a number of cell types, including neutrophils, monocytes, macrophages, and eosinophils. FCAR interacts with aggregated IgAs, such as IgA coated on the surface of an invading microorganism, and mediates several immunologic defense processes such as phagocytosis, antibody-dependent cell-mediated cytotoxicity, and stimulation of the release of inflammatory mediators. FCAR is a glycoprotein of 50 to 100 kD, with diversity on different cell types. Narita et al. (2001) examined polymorphisms in the promoter and 5-prime untranslated region of the FCAR gene in 151 patients with IgA nephropathy and 163 patients with other glomerular diseases shown to have no mesangial IgA deposition by renal biopsy. Haplotype analysis showed tight linkage disequilibrium among the polymorphisms. No significant association for the genotype, allele, and haplotype frequencies of the polymorphisms were shown between the patients with histologically proven IgA nephropathy and those with other glomerular diseases.

Thus, the analyzed polymorphisms did not appear to be primarily involved in susceptibility to IgA nephropathy.

[34809] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34810] Narita, I.; Goto, S.; Saito, N.; Sakatsume, M.; Jin, S.; Omori, K.; Gejyo, F. : Genetic polymorphisms in the promoter and 5-prime UTR region of the Fc alpha receptor (CD89) are not associated with a risk of IgA nephropathy. J. Hum. Genet. 46: 694–698, 2001. ; and

[34811] Maliszewski, C. R.; March, C. J.; Schoenborn, M. A.; Gimpel, S.; Shen, L. : Expression cloning of a human Fc receptor for IgA. J. Exp. Med. 172: 1665–1672, 1990.

[34812] Further studies establishing the function and utilities of FCAR are found in John Hopkins OMIM database record ID 147045, and in cited publications numbered 3162–3164, 3158–316 and 3165–3166 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GM2 Ganglioside Activator Protein (GM2A, Accession XM\_041978) is another VGAM923 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:33656, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34813] Another function of VGAM923 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM\_041978). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. G Protein-coupled Receptor 81 (GPR81, Accession NM\_032554) is another VGAM923 host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:26278, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34814] Another function of VGAM923 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession

NM\_032554). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81. HCS (Accession NM\_018947) is another VGAM923 host target gene. HCS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCS BINDING SITE, designated SEQ ID:21013, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34815] Another function of VGAM923 is therefore inhibition of HCS (Accession NM\_018947). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCS. Interleukin 11 (IL11, Accession NM\_000641) is another VGAM923 host target gene. IL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL11 BINDING SITE, desig-

nated SEQ ID:6277, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34816] Another function of VGAM923 is therefore inhibition of Interleukin 11 (IL11, Accession NM\_000641), a gene which stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11. The function of IL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM\_000903) is another VGAM923 host target gene. NQO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NQO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NQO1 BINDING SITE, designated SEQ ID:6605, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ

ID:3634.

[34817] Another function of VGAM923 is therefore inhibition of NAD(P)H Dehydrogenase, Quinone 1 (NQO1, Accession NM\_000903), a gene which is cytochrome b5 reductase which reduces redox dyes and quinones. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NQO1. The function of NQO1 has been established by previous studies. By study of man–mouse somatic cell hybrids, Grzeschik (1980) and Povey et al. (1980) identified a fourth diaphorase locus (DIA4) which segregates with chromosome 16. The regional assignment was 16q12–q22 (smallest region of overlap, SRO). Edwards et al. (1983) showed that the quantitative polymorphism of DIA4 can be attributed to the segregation of a 'low activity' allele. In 4 to 6% of persons there is a DIA4–absent phenotype. In a series of human/hamster hybrids, made using a human parental cell heterozygous for both phosphoglycolate phosphatase (PGP; 172280) and DIA4, the low activity allele and the PGP(2) allele cosegregated except in 2 of 16 discordant hybrids. DIA4 is presumably the same as NAD(P)H:menadione oxidoreductase (NMOR1). Jaiswal et al. (1988) showed that tetrachlorodibenzo–

p-dioxin (TCDD) treatment of a human hepatoblastoma cell produced a 5-fold induction of NMOR1 activity. They isolated several overlapping human NMOR1 cDNAs.

Southern blot analysis of human genomic DNA suggested the presence of a single NMOR1 gene approximately 10 kb long. They identified 4 potential polyadenylation sites and found 3 mRNAs in human cells. The 3 mRNA species appeared to be differentially regulated following TCDD treatment. By means of Southern blot analysis of genomic DNA from human/rodent somatic cell hybrids, Jaiswal et al. (1988) demonstrated that the gene is located on chromosome 16, consistent with the assignment of DIA4 to that chromosome. By means of mouse/human somatic cell hybrids containing rearranged chromosome 16 together with multiple probes, Chen et al. (1991) assigned the NMOR1 locus to 16q22.1. Animal model experiments lend further support to the function of NQO1. Radjendirane et al. (1998) generated Nqo1-null mice by targeted disruption. Mice lacking NQO1 gene expression were indistinguishable from wildtype mice. However, Nqo1-null mice exhibited increased toxicity when administered menadione compared with wildtype mice. These results established a role for NQO1 in protection against quinone

toxicity.

- [34818] It is appreciated that the abovementioned animal model for NQO1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [34819] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [34820] Jaiswal, A. K.; McBride, O. W.; Adesnik, M.; Nebert, D. W. : Human dioxin-inducible cytosolic NAD(P)H:menadione oxidoreductase: cDNA sequence and localization of gene to chromosome 16. J. Biol. Chem. 263: 13572–13578, 1988. ; and

- [34822] Further studies establishing the function and utilities of NQO1 are found in John Hopkins OMIM database record ID 125860, and in cited publications numbered 11858–11867, 1187 and 11868–11872 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoribosylaminoimidazole Car-

boxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452) is another VGAM923 host target gene. PAICS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAICS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAICS BINDING SITE, designated SEQ ID:13161, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34823] Another function of VGAM923 is therefore inhibition of Phosphoribosylaminoimidazole Carboxylase, Phosphoribosylaminoimidazole Succinocarboxamide Synthetase (PAICS, Accession NM\_006452), a gene which is required for purine biosynthesis. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAICS. The function of PAICS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005) is another VGAM923 host target gene.

PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15206, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34824] Another function of VGAM923 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM923 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3C2B, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8503, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34825] Another function of VGAM923 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Rhesus Blood Group, D Antigen (RHD, Accession NM\_016124) is another VGAM923 host target gene. RHD BINDING SITE1 and RHD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:18213 and SEQ ID:18333 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34826] Another function of VGAM923 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM\_016124), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM\_006089) is another VGAM923 host target gene. SCML2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:12734, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34827] Another function of VGAM923 is therefore inhibition of Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM\_006089). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with SCML2. Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM\_014563) is another VGAM923 host target gene. SEDL BINDING SITE1 through SEDL BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 through SEDL BINDING SITE3, designated SEQ ID:15900, SEQ ID:15901 and SEQ ID:15899 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34828] Another function of VGAM923 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM\_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Serine (or cysteine) Proteinase

Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155) is another VGAM923 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10357, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34829] Another function of VGAM923 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Mem-

ber 1 (SLC24A1, Accession NM\_004727) is another VGAM923 host target gene. SLC24A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC24A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:11099, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34830] Another function of VGAM923 is therefore inhibition of Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM\_004727), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1. The function of SLC24A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Ac-

cession NM\_003842) is another VGAM923 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9933, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34831] Another function of VGAM923 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. AAK1 (Accession NM\_014911) is another VGAM923 host target gene. AAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AAK1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:17143, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34832] Another function of VGAM923 is therefore inhibition of AAK1 (Accession NM\_014911). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1. ADMP (Accession NM\_145035) is another VGAM923 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29658, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34833] Another function of VGAM923 is therefore inhibition of ADMP (Accession NM\_145035). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ADMP. Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession XM\_046024) is another VGAM923 host target gene. ASB16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ASB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:34652, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34834] Another function of VGAM923 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession XM\_046024). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172) is another VGAM923 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30433, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34835] Another function of VGAM923 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. CIP29 (Accession NM\_032364) is another VGAM923 host target gene. CIP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE, designated SEQ ID:26147, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34836] Another function of VGAM923 is therefore inhibition of CIP29 (Accession NM\_032364). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29.

DKFZp434C0923 (Accession NM\_017598) is another VGAM923 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19061, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34837] Another function of VGAM923 is therefore inhibition of DKFZp434C0923 (Accession NM\_017598). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. DKFZP566I1024 (Accession XM\_046506) is another VGAM923 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE,

designated SEQ ID:34733, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34838] Another function of VGAM923 is therefore inhibition of DKFZP566I1024 (Accession XM\_046506). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. FLJ10535 (Accession NM\_018129) is another VGAM923 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:19915, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34839] Another function of VGAM923 is therefore inhibition of FLJ10535 (Accession NM\_018129). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10956 (Accession NM\_018283) is another VGAM923 host target gene. FLJ10956 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:20274, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34840] Another function of VGAM923 is therefore inhibition of FLJ10956 (Accession NM\_018283). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. FLJ13072 (Accession XM\_117117) is another VGAM923 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43231, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34841] Another function of VGAM923 is therefore inhibition of

FLJ13072 (Accession XM\_117117). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. FLJ13952 (Accession NM\_024798) is another VGAM923 host target gene. FLJ13952 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13952 BINDING SITE, designated SEQ ID:24175, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34842] Another function of VGAM923 is therefore inhibition of FLJ13952 (Accession NM\_024798). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13952. FLJ14803 (Accession NM\_032842) is another VGAM923 host target gene. FLJ14803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:26624, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34843] Another function of VGAM923 is therefore inhibition of FLJ14803 (Accession NM\_032842). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803. FLJ20045 (Accession NM\_017638) is another VGAM923 host target gene. FLJ20045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20045 BINDING SITE, designated SEQ ID:19143, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34844] Another function of VGAM923 is therefore inhibition of FLJ20045 (Accession NM\_017638). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20045. FLJ20671 (Accession NM\_017924) is another VGAM923

host target gene. FLJ20671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE, designated SEQ ID:19590, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34845] Another function of VGAM923 is therefore inhibition of FLJ20671 (Accession NM\_017924). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671. FLJ22969 (Accession XM\_044006) is another VGAM923 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34063, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34846] Another function of VGAM923 is therefore inhibition of FLJ22969 (Accession XM\_044006). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22969. FLJ23356 (Accession NM\_032237) is another VGAM923 host target gene. FLJ23356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23356 BINDING SITE, designated SEQ ID:25956, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34847] Another function of VGAM923 is therefore inhibition of FLJ23356 (Accession NM\_032237). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23356. GR6 (Accession NM\_007354) is another VGAM923 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14279, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34848] Another function of VGAM923 is therefore inhibition of GR6 (Accession NM\_007354). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. HSPC065 (Accession NM\_014157) is another VGAM923 host target gene. HSPC065 BINDING SITE1 and HSPC065 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HSPC065, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE1 and HSPC065 BINDING SITE2, designated SEQ ID:15447 and SEQ ID:15448 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34849] Another function of VGAM923 is therefore inhibition of HSPC065 (Accession NM\_014157). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HSPC065. KIAA0513 (Accession NM\_014732) is another VGAM923 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16350, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34850] Another function of VGAM923 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0527 (Accession XM\_171054) is another VGAM923 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45839, to the

nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34851] Another function of VGAM923 is therefore inhibition of KIAA0527 (Accession XM\_171054). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA1041 (Accession NM\_014947) is another VGAM923 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17262, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34852] Another function of VGAM923 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1198 (Accession XM\_032674) is another VGAM923 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31700, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34853] Another function of VGAM923 is therefore inhibition of KIAA1198 (Accession XM\_032674). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1200 (Accession XM\_031054) is another VGAM923 host target gene. KIAA1200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31261, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34854] Another function of VGAM923 is therefore inhibition of KIAA1200 (Accession XM\_031054). Accordingly, utilities

of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1200. KIAA1257 (Accession XM\_031577) is another VGAM923 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31427, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34855] Another function of VGAM923 is therefore inhibition of KIAA1257 (Accession XM\_031577). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. KIAA1655 (Accession XM\_039442) is another VGAM923 host target gene. KIAA1655 BINDING SITE1 and KIAA1655 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1655, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA1655 BINDING SITE1 and KIAA1655 BINDING SITE2, designated SEQ ID:33079 and SEQ ID:33080 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34856] Another function of VGAM923 is therefore inhibition of KIAA1655 (Accession XM\_039442). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1878 (Accession XM\_166256) is another VGAM923 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:44073, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34857] Another function of VGAM923 is therefore inhibition of KIAA1878 (Accession XM\_166256). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1878. MGC13138 (Accession NM\_033410) is another VGAM923 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:27231, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34858] Another function of VGAM923 is therefore inhibition of MGC13138 (Accession NM\_033410). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138. MGC15606 (Accession NM\_145037) is another VGAM923 host target gene. MGC15606 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15606 BINDING SITE, designated SEQ ID:29660, to the nucleotide sequence of VGAM923 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3634.

[34859] Another function of VGAM923 is therefore inhibition of MGC15606 (Accession NM\_145037). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15606. NADH Dehydrogenase (ubiquinone) 1, Sub-complex Unknown, 2, 14.5kDa (NDUFC2, Accession NM\_004549) is another VGAM923 host target gene. NDUFC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDUFC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFC2 BINDING SITE, designated SEQ ID:10893, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34860] Another function of VGAM923 is therefore inhibition of NADH Dehydrogenase (ubiquinone) 1, Subcomplex Unknown, 2, 14.5kDa (NDUFC2, Accession NM\_004549). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFC2. PP1201 (Accession NM\_022152) is

another VGAM923 host target gene. PP1201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1201 BINDING SITE, designated SEQ ID:22710, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34861] Another function of VGAM923 is therefore inhibition of PP1201 (Accession NM\_022152). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1201. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617) is another VGAM923 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6220, to the nucleotide sequence of VGAM923 RNA,

herein designated VGAM RNA, also designated SEQ ID:3634.

[34862] Another function of VGAM923 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM\_000617). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM\_024628) is another VGAM923 host target gene. SLC12A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A8 BINDING SITE, designated SEQ ID:23892, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34863] Another function of VGAM923 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 8 (SLC12A8, Accession NM\_024628). Accordingly, utilities of VGAM923 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SLC12A8. Tripartite Motif-containing 16 (TRIM16, Accession NM\_006470) is another VGAM923 host target gene. TRIM16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM16 BINDING SITE, designated SEQ ID:13194, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34864] Another function of VGAM923 is therefore inhibition of Tripartite Motif-containing 16 (TRIM16, Accession NM\_006470). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM16. Tripartite Motif-containing 5 (TRIM5, Accession NM\_033034) is another VGAM923 host target gene. TRIM5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TRIM5 BINDING SITE, designated SEQ ID:26926, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34865] Another function of VGAM923 is therefore inhibition of Tripartite Motif-containing 5 (TRIM5, Accession NM\_033034). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM5. Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM\_022916) is another VGAM923 host target gene. VPS33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS33A BINDING SITE, designated SEQ ID:23230, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34866] Another function of VGAM923 is therefore inhibition of Vacuolar Protein Sorting 33A (yeast) (VPS33A, Accession NM\_022916). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with VPS33A. LOC119392 (Accession NM\_145247) is another VGAM923 host target gene. LOC119392 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC119392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119392 BINDING SITE, designated SEQ ID:29758, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34867] Another function of VGAM923 is therefore inhibition of LOC119392 (Accession NM\_145247). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119392. LOC128989 (Accession XM\_059310) is another VGAM923 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36938, to

the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34868] Another function of VGAM923 is therefore inhibition of LOC128989 (Accession XM\_059310). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC135154 (Accession XM\_059752) is another VGAM923 host target gene. LOC135154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135154 BINDING SITE, designated SEQ ID:37090, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34869] Another function of VGAM923 is therefore inhibition of LOC135154 (Accession XM\_059752). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135154. LOC147166 (Accession XM\_085722) is another VGAM923 host target gene. LOC147166 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC147166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147166 BINDING SITE, designated SEQ ID:38312, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34870] Another function of VGAM923 is therefore inhibition of LOC147166 (Accession XM\_085722). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147166. LOC148195 (Accession XM\_097419) is another VGAM923 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40870, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34871] Another function of VGAM923 is therefore inhibition of LOC148195 (Accession XM\_097419). Accordingly, utilities

of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC149577 (Accession XM\_097675) is another VGAM923 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41020, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34872] Another function of VGAM923 is therefore inhibition of LOC149577 (Accession XM\_097675). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577. LOC152343 (Accession XM\_087441) is another VGAM923 host target gene. LOC152343 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152343 BINDING SITE, designated SEQ ID:39259, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34873] Another function of VGAM923 is therefore inhibition of LOC152343 (Accession XM\_087441). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC152620 (Accession XM\_011108) is another VGAM923 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30170, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34874] Another function of VGAM923 is therefore inhibition of LOC152620 (Accession XM\_011108). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC152719 (Accession XM\_098257) is another VGAM923 host target gene. LOC152719 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152719 BINDING SITE, designated SEQ ID:41542, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34875] Another function of VGAM923 is therefore inhibition of LOC152719 (Accession XM\_098257). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152719. LOC158476 (Accession XM\_098955) is another VGAM923 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41993, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34876] Another function of VGAM923 is therefore inhibition of

LOC158476 (Accession XM\_098955). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC158549 (Accession XM\_098963) is another VGAM923 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42003, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34877] Another function of VGAM923 is therefore inhibition of LOC158549 (Accession XM\_098963). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC161829 (Accession XM\_091161) is another VGAM923 host target gene. LOC161829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC161829 BINDING SITE, designated SEQ ID:40035, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34878] Another function of VGAM923 is therefore inhibition of LOC161829 (Accession XM\_091161). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161829. LOC163590 (Accession NM\_145034) is another VGAM923 host target gene. LOC163590 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163590 BINDING SITE, designated SEQ ID:29651, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34879] Another function of VGAM923 is therefore inhibition of LOC163590 (Accession NM\_145034). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163590. LOC202025 (Accession XM\_117353) is an-

other VGAM923 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43398, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34880] Another function of VGAM923 is therefore inhibition of LOC202025 (Accession XM\_117353). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. LOC202908 (Accession XM\_114602) is another VGAM923 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42993, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34881] Another function of VGAM923 is therefore inhibition of LOC202908 (Accession XM\_114602). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC202934 (Accession XM\_117486) is another VGAM923 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43451, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34882] Another function of VGAM923 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC220662 (Accession XM\_165978) is another VGAM923 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43820, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34883] Another function of VGAM923 is therefore inhibition of LOC220662 (Accession XM\_165978). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662. LOC222070 (Accession XM\_168433) is another VGAM923 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45175, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34884] Another function of VGAM923 is therefore inhibition of LOC222070 (Accession XM\_168433). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222070. LOC256306 (Accession XM\_172976) is another VGAM923 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:46233, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34885] Another function of VGAM923 is therefore inhibition of LOC256306 (Accession XM\_172976). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. LOC51200 (Accession NM\_016352) is another VGAM923 host target gene. LOC51200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51200 BINDING SITE, designated SEQ ID:18478, to the nucleotide sequence of VGAM923 RNA, herein designated

VGAM RNA, also designated SEQ ID:3634.

[34886] Another function of VGAM923 is therefore inhibition of LOC51200 (Accession NM\_016352). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51200. LOC51219 (Accession NM\_016418) is another VGAM923 host target gene. LOC51219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51219 BINDING SITE, designated SEQ ID:18543, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34887] Another function of VGAM923 is therefore inhibition of LOC51219 (Accession NM\_016418). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51219. LOC90333 (Accession XM\_030958) is another VGAM923 host target gene. LOC90333 BINDING SITE1 and LOC90333 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

LOC90333, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE1 and LOC90333 BINDING SITE2, designated SEQ ID:31215 and SEQ ID:31216 respectively, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34888] Another function of VGAM923 is therefore inhibition of LOC90333 (Accession XM\_030958). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC93408 (Accession NM\_138403) is another VGAM923 host target gene. LOC93408 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93408 BINDING SITE, designated SEQ ID:28772, to the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, also designated SEQ ID:3634.

[34889] Another function of VGAM923 is therefore inhibition of

LOC93408 (Accession NM\_138403). Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 924 (VGAM924) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34890] VGAM924 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM924 was detected is described hereinabove with reference to Figs. 1–8.

[34891] VGAM924 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34892] VGAM924 gene encodes a VGAM924 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM924 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM924 precursor RNA is designated SEQ ID:910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:910 is located at position 67724 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[34893] VGAM924 precursor RNA folds onto itself, forming VGAM924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34894] An enzyme complex designated DICER COMPLEX, `dices` the VGAM924 folded precursor RNA into VGAM924 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM924 RNA is designated SEQ ID:3635, and is provided hereinbelow with reference to the sequence listing part.

[34895] VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM924 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[34896] VGAM924 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM924 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM924 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[34897] The complementary binding of VGAM924 RNA, herein designated VGAM RNA, to host target binding sites on VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM924 host target RNA into VGAM924 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34898] It is appreciated that VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM924 host target genes. The mRNA of each one of this plurality of VGAM924 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM924 RNA, herein designated VGAM RNA, and which when bound by VGAM924 RNA causes inhibition of translation of respective one or more VGAM924 host target proteins.

[34899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM924 gene, herein designated VGAM GENE, on one or more VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34900] It is yet further appreciated that a function of VGAM924 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM924 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM924 correlate with, and may be deduced from, the identity of the host target genes which VGAM924 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34901] Nucleotide sequences of the VGAM924 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM924 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM924 are further described hereinbelow with reference to Table 1.

[34902] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM924 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM924 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34903] As mentioned hereinabove with reference to Fig. 1, a function of VGAM924 gene, herein designated VGAM is inhibition of expression of VGAM924 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM924 correlate with, and may be deduced from, the identity of the target genes which VGAM924 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34904] Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM\_004768) is a VGAM924 host target gene. SFRS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS11 BINDING SITE, designated SEQ ID:11159, to the nucleotide sequence of VGAM924 RNA, herein designated VGAM RNA, also designated SEQ ID:3635.

[34905] A function of VGAM924 is therefore inhibition of Splicing Factor, Arginine/serine-rich 11 (SFRS11, Accession NM\_004768). Accordingly, utilities of VGAM924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS11. LOC205251

(Accession XM\_119554) is another VGAM924 host target gene. LOC205251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205251 BINDING SITE, designated SEQ ID:43592, to the nucleotide sequence of VGAM924 RNA, herein designated VGAM RNA, also designated SEQ ID:3635.

[34906] Another function of VGAM924 is therefore inhibition of LOC205251 (Accession XM\_119554). Accordingly, utilities of VGAM924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 925 (VGAM925) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34907] VGAM925 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM925 was detected is described hereinabove with reference to Figs. 1–8.

[34908] VGAM925 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34909] VGAM925 gene encodes a VGAM925 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM925 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM925 precursor RNA is designated SEQ ID:911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:911 is located at position 67920 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[34910] VGAM925 precursor RNA folds onto itself, forming VGAM925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34911] An enzyme complex designated DICER COMPLEX, `dices` the VGAM925 folded precursor RNA into VGAM925 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM925 RNA is designated SEQ ID:3636, and is provided hereinbelow with reference to the sequence listing part.

[34912] VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM925 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34913] VGAM925 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM925 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM925 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[34914] The complementary binding of VGAM925 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM925 host target RNA into VGAM925 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34915] It is appreciated that VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM925 host target genes. The mRNA of each one of this plurality of VGAM925 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM925 RNA, herein designated VGAM RNA, and which when bound by VGAM925 RNA causes inhibition of translation of respective one or more VGAM925 host target proteins.

[34916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM925 gene, herein designated VGAM GENE, on one or more VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34917] It is yet further appreciated that a function of VGAM925 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM925 correlate with, and may be deduced from, the identity of the host target genes which VGAM925 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34918] Nucleotide sequences of the VGAM925 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM925 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM925 are further described hereinbelow with reference to Table 1.

[34919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM925 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM925 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34920] As mentioned hereinabove with reference to Fig. 1, a function of VGAM925 gene, herein designated VGAM is inhibition of expression of VGAM925 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM925 correlate with, and may be deduced from, the identity of the target genes which VGAM925 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34921] Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 (X11-like) (APBA2, Accession NM\_005503) is a VGAM925 host target gene. APBA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by APBA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA2 BINDING SITE, designated SEQ ID:12016, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34922] A function of VGAM925 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 (X11-like) (APBA2, Accession NM\_005503), a gene which interacts with and stabilises the Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA2. The function of APBA2 has been established by previous studies. The cytoplasmic domain of the Alzheimer disease locus amyloid protein precursor (APP; 104760) binds to 4 human phosphotyrosine-binding (PTB) proteins; see APBA1 (OMIM Ref. No. 602414). By use of a yeast 2-hybrid screening of a human brain cDNA library, McLoughlin and Miller (1996) identified 3 of these proteins: the human homolog of rat Fe65 (APBB1; 602709), an Fe65-like se-

quence (APBB2; 602710), and an X11-like sequence (APBA2). The human X11-like sequence is 83% identical to that encoded by the X11 gene (APBA1; 602414).

McLoughlin and Miller (1996) detected a phosphotyrosine-binding domain in the protein encoded by the X11-like clone. Using a radiation hybrid panel, Blanco et al. (1998) mapped the APBA2 gene to human chromosome 15, between markers WI-5590 (10.31 cR) and D15S144 (21.7 cR). In an interspecific backcross, using an SSCP-demonstrated polymorphism, they assigned the Apba2 gene to mouse chromosome 7. The location of the flanking markers suggested that Apba2 is a further addition to a gene segment conserved between mouse chromosome 7 and human 15q.

[34923] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34924] Blanco, G.; Irving, N. G.; Brown, S. D. M.; Miller, C. C. J.; McLoughlin, D. M. : Mapping of the human and murine X11-like genes (APBA2 and Apba2), the murine Fe65 gene (Apbb1), and the human Fe65-like gene (APBB2): genes encoding phosphotyrosine-binding domain proteins that interact with the Alzheimer's disease amyloid precursor

protein. Mammalian Genome 9: 473–475, 1998. ; and

[34925] McLoughlin, D. M.; Miller, C. C. J. : The intracellular cytoplasmic domain of the Alzheimer's disease amyloid precursor protein interacts with phosphotyrosine-binding domain proteins in.

[34926] Further studies establishing the function and utilities of APBA2 are found in John Hopkins OMIM database record ID 602712, and in cited publications numbered 101 and 1118 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DNA

(cytosine–5–)-methyltransferase 3 Alpha (DNMT3A, Accession NM\_022552) is another VGAM925 host target gene. DNMT3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DNMT3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3A BINDING SITE, designated SEQ ID:22881, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34927] Another function of VGAM925 is therefore inhibition of DNA (cytosine–5–)-methyltransferase 3 Alpha (DNMT3A,

Accession NM\_022552), a gene which intervenes in de novo methylation of DNA. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3A. The function of DNMT3A has been established by previous studies. De novo methylation of genomic DNA is a developmentally regulated process that appears to play a pivotal role in regulation of genomic imprinting and X-chromosome inactivation in mammals. Aberrant de novo methylation of growth regulatory genes is associated with tumorigenesis in humans (Baylin et al., 1998). However, Lei et al. (1996) showed that de novo methylation persists in embryonic stem (ES) cells lacking Dnmt1 (OMIM Ref. No. 126375), which encodes the constitutive DNA methyltransferase 1, indicating the existence of independently encoded de novo methyltransferases. By a TBLASTN search of the dbEST database using full-length bacterial type II cytosine-5 methyltransferase sequences as queries, followed by isolation and sequencing of overlapping cDNA clones, Okano et al. (1998) identified 2 homologous genes in both human and mouse that contain the highly conserved cytosine-5 methyltransferase motifs. The mouse genes, termed Dnmt3a and Dnmt3b (OMIM Ref. No.

602900), show little sequence similarity to mouse Dnmt1 and Dnmt2 (OMIM Ref. No. 602478), and masc1 from *Ascobolus*. The Dnmt3a cDNA is 4,192 bp in length, encoding a protein of 908 amino acids. The human DNMT3A and DNMT3B cDNA are highly homologous to the mouse genes. Dnmt3a and Dnmt3b transcripts are abundantly expressed in undifferentiated embryonic stem cells. Okano et al. (1998) performed other experiments suggesting that Dnmt3a and Dnmt3b encode the long-sought de novo DNA methyltransferases. By FISH, Xie et al. (1999) mapped the DNMT3A gene to 2p23. Robertson et al. (1999) also mapped the DNMT3A gene to 2p23 using FISH. Animal model experiments lend further support to the function of DNMT3A. Okano et al. (1999) generated mice with targeted disruption of the Dnmt3a and Dnmt3b genes. Inactivation of both genes blocked de novo methylation in embryonic stem cells and early embryos but had no effect on maintenance of imprinted methylation patterns. Dnmt3a  $-/-$  mice developed to term and appeared to be normal at birth. However, most homozygous mutant mice became runted and died at about 4 weeks of age. In contrast, no viable Dnmt3b  $-/-$  mice were recovered at birth. Dissection of embryos at different stages of devel-

opment revealed that Dnmt3b  $-/-$  embryos had multiple developmental defects, including growth impairment and rostral neural tube defects with variable severity at later stages of development, though most of them appeared to develop normally before E9.5. Dnmt3a and Dnmt3b also exhibited nonoverlapping functions in development, with Dnmt3b specifically required for methylation of centromeric minor satellite repeats. These results indicated that both Dnmt3a and Dnmt3b are required for genomewide de novo methylation and are essential for mammalian development.

[34928] It is appreciated that the abovementioned animal model for DNMT3A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[34929] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34930] Okano, M.; Xie, S.; Li, E. : Cloning and characterization of a family of novel mammalian DNA (cytosine-5) methyltransferases. (Letter) Nature Genet. 19: 219-220, 1998. ; and

[34931] Robertson, K. D.; Uzvolgyi, E.; Liang, G.; Talmadge, C.;

Sumegi, J.; Gonzales, F. A.; Jones, P. A. : The human DNA methyltransferases (DNMTs) 1, 3a and 3b: coordinate mRNA expression in.

[34932] Further studies establishing the function and utilities of DNMT3A are found in John Hopkins OMIM database record ID 602769, and in cited publications numbered 6213–6214, 344 and 11685–6217 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DNA (cytosine–5–)-methyltransferase 3–like (DNMT3L, Accession NM\_013369) is another VGAM925 host target gene. DNMT3L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DNMT3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3L BINDING SITE, designated SEQ ID:15016, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34933] Another function of VGAM925 is therefore inhibition of DNA (cytosine–5–)-methyltransferase 3–like (DNMT3L, Accession NM\_013369), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of

VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L. The function of DNMT3L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM447. Fibroblast Growth Factor 18 (FGF18, Accession NM\_033649) is another VGAM925 host target gene. FGF18 BINDING SITE1 and FGF18 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF18, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF18 BINDING SITE1 and FGF18 BINDING SITE2, designated SEQ ID:27382 and SEQ ID:9954 respectively, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34934] Another function of VGAM925 is therefore inhibition of Fibroblast Growth Factor 18 (FGF18, Accession NM\_033649), a gene which stimulates hepatic and intestinal proliferation. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF18. The function of

FGF18 has been established by previous studies. The fibroblast growth factors (FGFs; e.g., FGF2; 134920) are a family of growth factors and oncogenes that contain a conserved, approximately 120-amino acid core. Individual FGFs play important roles in embryonic development, cell growth, morphogenesis, tissue repair, inflammation, angiogenesis, and tumor growth and invasion. Ohbayashi et al. (1998) isolated human, mouse, and rat cDNAs encoding a novel member of the FGF family, FGF18. The deduced 207-amino acid human and rat FGF18 proteins are 99% identical. FGF18 contains a typical hydrophobic signal sequence at its N terminus, and the authors demonstrated that recombinant rat Fgf18 can be efficiently secreted by High Five insect cells. Recombinant rat Fgf18 induced neurite outgrowth in PC12 cells. Northern blot analysis of rat adult tissues showed abundant expression of Fgf18 in lung but did not detect Fgf18 expression in other tissues. In rat 14.5- and 19.5-day embryos, in situ hybridization showed Fgf18 expression in several discrete regions. Independently, Hu et al. (1998) isolated human and mouse FGF18 cDNAs. Among known FGF family members, the FGF18 protein is most similar to FGF8 (OMIM Ref. No. 600483) and FGF17 (OMIM Ref. No. 603725), with human

FGF18 showing 60% and 58% identity with human FGF8 and FGF17, respectively. The authors demonstrated that recombinant mouse Fgf18 is glycosylated and can stimulate proliferation of NIH 3T3 cells in vitro in a heparan sulfate-dependent manner. Northern blot analysis of mouse adult tissues showed highest Fgf18 expression in the lung and kidney, and in situ hybridization of mouse 15.5-day embryos detected Fgf18 transcripts primarily in the lung. However, injection of recombinant mouse Fgf18 into normal mice induced proliferation in a wide variety of tissues, with the liver and small intestine appearing to be the primary targets. Hu et al. (1998) showed that transgenic mice overexpressing Fgf18 in the liver exhibited an increase in liver weight and hepatocellular proliferation. By radiation hybrid analysis and FISH, Whitmore et al. (2000) mapped the FGF18 gene to chromosome 5q34.

[34935] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34936] Ohbayashi, N.; Hoshikawa, M.; Kimura, S.; Yamasaki, M.; Fukui, S.; Itoh, N. : Structure and expression of the mRNA encoding a novel fibroblast growth factor, FGF-18. J. Biol. Chem. 273: 18161-18164, 1998. ; and

[34937] Whitmore, T. E.; Maurer, M. F.; Sexson, S.; Raymond, F.; Conklin, D.; Deisher, T. A. : Assignment of fibroblast growth factor 18 (FGF18) to human chromosome 5q34 by use of radiation hyb.

[34938] Further studies establishing the function and utilities of FGF18 are found in John Hopkins OMIM database record ID 603726, and in cited publications numbered 536 and 5836 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM\_166539) is another VGAM925 host target gene. LFNG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFNG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFNG BINDING SITE, designated SEQ ID:44508, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34939] Another function of VGAM925 is therefore inhibition of Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM\_166539). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with LFNG. Leukocyte Immunoglobulin-like Receptor, Subfamily A (with TM domain), Member 1 (LILRA1, Accession NM\_006863) is another VGAM925 host target gene. LILRA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LILRA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LILRA1 BINDING SITE, designated SEQ ID:13736, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34940] Another function of VGAM925 is therefore inhibition of Leukocyte Immunoglobulin-like Receptor, Subfamily A (with TM domain), Member 1 (LILRA1, Accession NM\_006863). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRA1. Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 2 (LILRB2, Accession NM\_005874) is another VGAM925 host target gene. LILRB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LILRB2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LILRB2 BINDING SITE, designated SEQ ID:12492, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34941] Another function of VGAM925 is therefore inhibition of Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 2 (LILRB2, Accession NM\_005874). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB2. Synapsin III (SYN3, Accession NM\_133632) is another VGAM925 host target gene. SYN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYN3 BINDING SITE, designated SEQ ID:28591, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34942] Another function of VGAM925 is therefore inhibition of Synapsin III (SYN3, Accession NM\_133632), a gene which

may be involved in the regulation of neurotransmitter release and synaptogenesis. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYN3. The function of SYN3 has been established by previous studies. Synapsins are a family of neuron-specific synaptic vesicle-associated phosphoproteins that have been implicated in synaptogenesis and in the modulation of neurotransmitter release. In mammals, distinct genes for synapsins I (SYN1; 313440) and II (SYN2; 600755) have been identified, each of which encodes 2 alternatively spliced isoforms. Kao et al. (1998) cloned and characterized a third member of the synapsin gene family, synapsin III, from human DNA. Synapsin III gives rise to at least 1 protein isoform, designated synapsin IIIa, in several mammalian species. Synapsin IIIa is associated with synaptic vesicles, and its expression appears to be neuron-specific. The primary structure of synapsin IIIa conforms to the domain model previously described for the synapsin family, with domains A, C, and E exhibiting the highest degree of conservation. Synapsin IIIa contains a novel domain, termed domain J, located between domains C and E. The similarities among synapsins I, II, and III in domain

organization, neuron-specific expression, and subcellular localization suggested a possible role for synapsin III in the regulation of neurotransmitter release and synaptogenesis. Hosaka and Sudhof (1998) identified the human SYN3 gene. Among the rat tissues tested, they found that Syn3 was expressed only in brain. As in other synapsins, the C domain of Syn3 bound ATP with high affinity and ADP with a lower affinity, consistent with a cycle of ATP binding and hydrolysis. However, unlike with Syn1 and Syn2, calcium inhibited ATP binding to Syn3. The authors concluded that calcium has distinct regulatory effects on Syn1, Syn2, and Syn3.

[34943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[34944] Hosaka, M.; Sudhof, T. C. : Synapsin III, a novel synapsin with an unusual regulation by  $\text{Ca}^{2+}$ . J. Biol. Chem. 273: 13371–13374, 1998. ; and

[34945] Kao, H.-T.; Porton, B.; Czernik, A. J.; Feng, J.; Yiu, G.; Har-  
ing, M.; Benfenati, F.; Greengard, P. : A third member of  
the synapsin gene family. Proc. Nat. Acad. Sci. 95:  
4667–4672, 19.

[34946] Further studies establishing the function and utilities of

SYN3 are found in John Hopkins OMIM database record ID 602705, and in cited publications numbered 1048–1051 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CLIPR–59 (Accession NM\_015526) is another VGAM925 host target gene. CLIPR–59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIPR–59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR–59 BINDING SITE, designated SEQ ID:17785, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34947] Another function of VGAM925 is therefore inhibition of CLIPR–59 (Accession NM\_015526). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR–59. FLJ22160 (Accession NM\_024585) is another VGAM925 host target gene. FLJ22160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22160 BINDING SITE, designated SEQ ID:23819, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34948] Another function of VGAM925 is therefore inhibition of FLJ22160 (Accession NM\_024585). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22160. HGC6.1.1 (Accession NM\_014354) is another VGAM925 host target gene. HGC6.1.1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HGC6.1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.1.1 BINDING SITE, designated SEQ ID:15686, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34949] Another function of VGAM925 is therefore inhibition of HGC6.1.1 (Accession NM\_014354). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.1.1.

KIAA0514 (Accession NM\_014696) is another VGAM925 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16211, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34950] Another function of VGAM925 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA1089 (Accession XM\_044148) is another VGAM925 host target gene. KIAA1089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1089 BINDING SITE, designated SEQ ID:34141, to the nucleotide sequence of VGAM925 RNA, herein designated

VGAM RNA, also designated SEQ ID:3636.

[34951] Another function of VGAM925 is therefore inhibition of KIAA1089 (Accession XM\_044148). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1089. KIAA1110 (Accession XM\_029973) is another VGAM925 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30983, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34952] Another function of VGAM925 is therefore inhibition of KIAA1110 (Accession XM\_029973). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110. KIAA1274 (Accession XM\_166125) is another VGAM925 host target gene. KIAA1274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1274, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43908, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34953] Another function of VGAM925 is therefore inhibition of KIAA1274 (Accession XM\_166125). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. KIAA1388 (Accession XM\_168030) is another VGAM925 host target gene. KIAA1388 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1388 BINDING SITE, designated SEQ ID:44949, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34954] Another function of VGAM925 is therefore inhibition of KIAA1388 (Accession XM\_168030). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1388. KIAA1533 (Accession XM\_057385) is another VGAM925 host target gene. KIAA1533 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1533 BINDING SITE, designated SEQ ID:36510, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34955] Another function of VGAM925 is therefore inhibition of KIAA1533 (Accession XM\_057385). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1533. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975) is another VGAM925 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12598,

to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34956] Another function of VGAM925 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM925 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16081, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34957] Another function of VGAM925 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Spindlin (SPIN, Accession XM\_005421) is another VGAM925 host target gene. SPIN

BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPIN BINDING SITE, designated SEQ ID:29979, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34958] Another function of VGAM925 is therefore inhibition of Spindlin (SPIN, Accession XM\_005421). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPIN. Serine Protease Inhibitor, Kunitz Type 1 (SPINT1, Accession XM\_031510) is another VGAM925 host target gene. SPINT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPINT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPINT1 BINDING SITE, designated SEQ ID:31391, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34959] Another function of VGAM925 is therefore inhibition of Serine Protease Inhibitor, Kunitz Type 1 (SPINT1, Accession XM\_031510). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINT1. Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517) is another VGAM925 host target gene. UBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBP1 BINDING SITE, designated SEQ ID:15845, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34960] Another function of VGAM925 is therefore inhibition of Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1. ZFP106 (Accession NM\_022473) is another VGAM925 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22834, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34961] Another function of VGAM925 is therefore inhibition of ZFP106 (Accession NM\_022473). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC147180 (Accession XM\_097207) is another VGAM925 host target gene. LOC147180 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147180 BINDING SITE, designated SEQ ID:40817, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34962] Another function of VGAM925 is therefore inhibition of LOC147180 (Accession XM\_097207). Accordingly, utilities

of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147180. LOC167040 (Accession XM\_106497) is another VGAM925 host target gene. LOC167040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC167040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC167040 BINDING SITE, designated SEQ ID:42200, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34963] Another function of VGAM925 is therefore inhibition of LOC167040 (Accession XM\_106497). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167040. LOC200213 (Accession XM\_114156) is another VGAM925 host target gene. LOC200213 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200213 BINDING SITE, designated SEQ ID:42739, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34964] Another function of VGAM925 is therefore inhibition of LOC200213 (Accession XM\_114156). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200213. LOC90170 (Accession XM\_029589) is another VGAM925 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE, designated SEQ ID:30907, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34965] Another function of VGAM925 is therefore inhibition of LOC90170 (Accession XM\_029589). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90170. LOC93624 (Accession XM\_052624) is another VGAM925 host target gene. LOC93624 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93624 BINDING SITE, designated SEQ ID:36014, to the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, also designated SEQ ID:3636.

[34966] Another function of VGAM925 is therefore inhibition of LOC93624 (Accession XM\_052624). Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93624. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 926 (VGAM926) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34967] VGAM926 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM926 was detected is described hereinabove with reference to Figs. 1-8.

[34968] VGAM926 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34969] VGAM926 gene encodes a VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM926 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM926 precursor RNA is designated SEQ ID:912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:912 is located at position 67259 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[34970] VGAM926 precursor RNA folds onto itself, forming VGAM926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[34971] An enzyme complex designated DICER COMPLEX, `dices` the VGAM926 folded precursor RNA into VGAM926 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM926 RNA is designated SEQ ID:3637, and is provided hereinbelow with reference to the sequence listing part.

[34972] VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM926 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34973] VGAM926 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM926 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM926 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM926 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[34974] The complementary binding of VGAM926 RNA, herein designated VGAM RNA, to host target binding sites on VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM926 host target RNA into VGAM926 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34975] It is appreciated that VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM926 host target genes. The mRNA of each one of this plurality of VGAM926 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM926 RNA, herein designated VGAM RNA, and which when bound by VGAM926 RNA causes inhibition of translation of respective one or more VGAM926 host target proteins.

[34976] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM926 gene, herein designated VGAM GENE, on one or more VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34977] It is yet further appreciated that a function of VGAM926 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM926 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM926 correlate with, and may be deduced from, the identity of the host target genes which VGAM926 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34978] Nucleotide sequences of the VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM926 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM926 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM926 are further described hereinbelow with reference to Table 1.

[34979] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM926 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM926 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34980] As mentioned hereinabove with reference to Fig. 1, a function of VGAM926 gene, herein designated VGAM is inhibition of expression of VGAM926 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM926 correlate with, and may be deduced from, the identity of the target genes which VGAM926 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[34981] Keratocan (KERA, Accession NM\_007035) is a VGAM926 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of KERA BINDING SITE, designated SEQ ID:13907, to the nucleotide sequence of VGAM926 RNA, herein designated VGAM RNA, also designated SEQ ID:3637.

[34982] A function of VGAM926 is therefore inhibition of Kerato-  
can (KERA, Accession NM\_007035), a gene which may be  
important in developing and maintaining corneal trans-  
parency and for the structure of the stromal matrix. Ac-  
cordingly, utilities of VGAM926 include diagnosis, preven-  
tion and treatment of diseases and clinical conditions as-  
sociated with KERA. The function of KERA and its associa-  
tion with various diseases and clinical conditions, has  
been established by previous studies, as described here-  
inabove with reference to VGAM723.HT008 (Accession  
XM\_008246) is another VGAM926 host target gene.  
HT008 BINDING SITE is HOST TARGET binding site found  
in the 3' untranslated region of mRNA encoded by  
HT008, corresponding to a HOST TARGET binding site  
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.  
Table 2 illustrates the complementarity of the nucleotide  
sequences of HT008 BINDING SITE, designated SEQ  
ID:30073, to the nucleotide sequence of VGAM926 RNA,  
herein designated VGAM RNA, also designated SEQ

ID:3637.

[34983] Another function of VGAM926 is therefore inhibition of HT008 (Accession XM\_008246). Accordingly, utilities of VGAM926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT008. LOC151827 (Accession XM\_087317) is another VGAM926 host target gene. LOC151827 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151827 BINDING SITE, designated SEQ ID:39168, to the nucleotide sequence of VGAM926 RNA, herein designated VGAM RNA, also designated SEQ ID:3637.

[34984] Another function of VGAM926 is therefore inhibition of LOC151827 (Accession XM\_087317). Accordingly, utilities of VGAM926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151827. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 927 (VGAM927) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[34985] VGAM927 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM927 was detected is described hereinabove with reference to Figs. 1–8.

[34986] VGAM927 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[34987] VGAM927 gene encodes a VGAM927 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM927 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM927 precursor RNA is designated SEQ ID:913, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:913 is located at position 65593 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[34988] VGAM927 precursor RNA folds onto itself, forming

VGAM927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[34989] An enzyme complex designated DICER COMPLEX, `dices` the VGAM927 folded precursor RNA into VGAM927 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM927 RNA is designated SEQ ID:3638, and is provided hereinbelow with reference to the sequence listing part.

[34990] VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM927 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[34991] VGAM927 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM927 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM927 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[34992] The complementary binding of VGAM927 RNA, herein designated VGAM RNA, to host target binding sites on VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM927 host target RNA into VGAM927 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[34993] It is appreciated that VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM927 host target genes. The mRNA of each one of this plurality of VGAM927 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM927 RNA, herein designated VGAM RNA, and which when bound by VGAM927 RNA causes inhibition of translation of respective one or more VGAM927 host target proteins.

[34994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM927 gene, herein designated VGAM GENE, on one or more VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[34995] It is yet further appreciated that a function of VGAM927 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM927 correlate with, and may be deduced from, the identity of the host target genes which

VGAM927 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[34996] Nucleotide sequences of the VGAM927 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM927 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM927 are further described hereinbelow with reference to Table 1.

[34997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM927 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM927 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[34998] As mentioned hereinabove with reference to Fig. 1, a function of VGAM927 gene, herein designated VGAM is inhibition of expression of VGAM927 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM927 correlate with, and may be deduced from, the identity of the target genes which VGAM927 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[34999] Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025) is a VGAM927 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5461, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35000] A function of VGAM927 is therefore inhibition of Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025), a gene which stimulates adenylyl cyclase activity and regulates lipolysis. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRB3. The function of ADRB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM\_007332) is another VGAM927 host target gene. ANKTM1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ ID:14259, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35001] Another function of VGAM927 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM\_007332), a gene which attaches integral membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174) is another VGAM927 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6840, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35002] Another function of VGAM927 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Attractin (ATRN, Accession NM\_139321) is another VGAM927 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29296, to the nucleotide sequence of VGAM927 RNA,

herein designated VGAM RNA, also designated SEQ ID:3638.

[35003] Another function of VGAM927 is therefore inhibition of Attractin (ATRN, Accession NM\_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898) is another VGAM927 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23158, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35004] Another function of VGAM927 is therefore inhibition of B-

cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Fibroblast Activation Protein, Alpha (FAP, Accession NM\_004460) is another VGAM927 host target gene. FAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAP BINDING SITE, designated SEQ ID:10766, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35005] Another function of VGAM927 is therefore inhibition of Fibroblast Activation Protein, Alpha (FAP, Accession NM\_004460), a gene which may have a role in tissue remodeling during development and wound healing. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAP. The function of FAP has been established by previous studies. Fibroblast activation protein-alpha (FAP-alpha) is an inducible cell surface glycoprotein

that was originally identified in cultured fibroblasts using monoclonal antibody F19. Immunohistochemical studies have shown that FAP- $\alpha$  is transiently expressed in certain normal fetal mesenchymal tissues but that normal adult tissues as well as malignant epithelial, neural, and hematopoietic cells are generally FAP- $\alpha$ -negative. However, most of the common types of epithelial cancers contain abundant FAP- $\alpha$ -reactive stromal fibroblasts. Scanlan et al. (1994) cloned an FAP- $\alpha$  cDNA from a WI-38 human fibroblast cDNA expression library by immunoselection using antibody F19. The predicted 760-amino acid FAP- $\alpha$  protein (GenBank 1888316) is a type II integral membrane protein with a large C-terminal extracellular domain, which contains 6 potential N-glycosylation sites, 13 cysteine residues, and 3 segments that correspond to highly conserved catalytic domains of serine proteases; a hydrophobic transmembrane segment; and a short cytoplasmic tail. FAP- $\alpha$  shows 48% amino acid identity with dipeptidyl peptidase IV (DPP4; 102720) and 30% identity with DPP4-related protein (DPPX; 126141). Northern blot analysis detected a 2.8-kb FAP- $\alpha$  mRNA in fibroblasts. Seprase is a 170-kD integral membrane gelatinase whose expression

correlates with the invasiveness of human melanoma and carcinoma cells. Goldstein et al. (1997) cloned and characterized a seprase cDNA. They suggested that seprase and FAP-alpha are the same protein and products of the same gene. Pineiro-Sanchez et al. (1997) isolated seprase protein from the cell membranes and shed vesicles of human melanoma LOX cells. Serine protease inhibitors blocked the gelatinase activity of seprase, suggesting that seprase contains a catalytically active serine residue(s). The authors found that seprase is composed of monomeric, N-glycosylated 97-kD subunits that are proteolytically inactive. They concluded that seprase is similar to DPP4 in that their proteolytic activities are dependent upon subunit association.

[35006] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[35009] Further studies establishing the function and utilities of FAP are found in John Hopkins OMIM database record ID 600403, and in cited publications numbered 7113–7116 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309) is another VGAM927 host target gene. LIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIF BINDING SITE, designated SEQ ID:8097, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35010] Another function of VGAM927 is therefore inhibition of Leukemia Inhibitory Factor (cholinergic differentiation factor) (LIF, Accession NM\_002309). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIF. Phos-

phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765) is another VGAM927 host target gene. PRPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS2 BINDING SITE, designated SEQ ID:8655, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35011] Another function of VGAM927 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765), a gene which generates the PRPP needed for initiation of purine biosynthesis. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPS2. The function of PRPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM828. Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452) is another VGAM927 host target gene. SLC10A2 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by SLC10A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC10A2 BINDING SITE, designated SEQ ID:6064, to the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, also designated SEQ ID:3638.

[35012] Another function of VGAM927 is therefore inhibition of Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452). Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC10A2. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473) is another VGAM927 host target gene. STAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM BINDING SITE, designated SEQ ID:9539, to the nucleotide sequence of VGAM927 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3638.

[35013] Another function of VGAM927 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473), a gene which is as an adaptor molecule involved in the downstream signaling of cytokine receptors. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM. The function of STAM has been established by previous studies. Stimulation of cells with cytokines results in a signal transduction cascade involving cytokine receptors, Janus kinases (JAKs) and signal transducers and activators of transcription (STATs). In order to investigate signal transduction downstream of JAK3 (OMIM Ref. No. 600173), Takeshita et al. (1996) screened for molecules induced after stimulation of cells with the cytokine IL2 (OMIM Ref. No. 147680). Their screen identified a novel molecule, which they named STAM for 'signal-transducing adaptor molecule.' They cloned the human STAM cDNA from a T-cell cDNA library and found that it encodes a 540-amino acid polypeptide. The approximately 70-kD protein product was precipitated by anti-phosphotyrosine. Northern blot analysis indicated that STAM was expressed

as a 2.9-kb message in all tissue and cell types examined. The STAM sequence contains a Src-homology 3 (SH3) domain and an immunoreceptor tyrosine-based activation motif (ITAM). Takeshita et al. (1996) suggested that STAM acts as an adaptor molecule in signal transduction pathways from cytokine receptors. Asao et al. (1997) showed that HGS (OMIM Ref. No. 604375) binds to STAM via coiled-coil sequences and appears to regulate proliferation in response to cytokines.
